TRANSMITTAL LETTER UNDER 37 C.F.R. § 1.53
AND M.P.E.P. § 601.01

Sir:

Enclosed herewith for filing is a specification under 37 C.F.R. § 1.71; claims under 37 C.F.R. § 1.75; and drawings under 37 C.F.R. § 1.81 for a patent application for NETWORK DATA BASE CONTROL DEVICE AND METHOD THEREOF on behalf of the inventor under 37 C.F.R. § 1.41(c), TOSHIAKI IGARASHI, having a post office address of 321-1-305, Kimihirama, Nakahara-ku, Kawasaki-shi, Kanagawa-ken, Japan; AKIRA SUGIYAMA, having a post office address of 1447-1-606, Suenaga, Takatsu-ku, Kawasaki-shi, Kanagawa-ken, Japan; YOSHIO IIZUKA, having a post office address of 4-20-302, Denenchofu 2-chome, Ohta-ku, Tokyo, Japan; and MINORU TORII,

having a post office address of 985-1-3-204, Matsumicho 4-chome, Kanagawa-ku, Yokohama-shi, Kanagawa-ken, Japan.

Priority is based upon Japanese Patent Application Nos. 9-034338 filed February 3, 1997; and 9-034340 filed February 3, 1997.

The undersigned is authorized to file the subject application on behalf of the inventor.

Applicants' undersigned attorney may be reached in our New York office by telephone at (212) 758-2400. All correspondence should be directed to our below listed address.

Respectfully submitted,

Abigail Cousins
Attorney for Applicants

TITLE OF THE INVENTION

NETWORK DATA BASE CONTROL DEVICE AND METHOD THEREOF

5

BACKGROUND OF THE INVENTION

This invention relates to a network control device and method including network control software.

10 In recent years local area networks (LAN) for connecting computers together have become widespread. These type of local area networks are capable of connecting computers in the same floor of a building or the entire building, a group of buildings, a district or even larger areas and can even connect to networks on a worldwide scale.

15 Each of these mutually connected local area networks (LAN) may utilize diverse hardware connection technology or a plurality of network protocol.

Other isolated local area networks (LAN) of simple structure can be supervised by individual users. In other

20 words, the user can replace equipment, install software and diagnose problems.

However, large-scale complex LAN and large, mutually interconnected LAN groups require management referred to here as "Management". This "Management" means

both a person to act as the network administrator and the software used by the network administrator. In this document, the term "management" signifies control utilizing software to manage the entire system, and the term "user" signifies
5 the person utilizing the network control software. The user usually acts as the system control administrator. The user can make use of the network control software to obtain control data on the network and change this data.

Large-scale network systems are usually required
10 to be active systems that must constantly perform equipment expansion or removal, software updating and problem detection, etc. Generally, such systems are owned by various persons or exist as various systems supplied by various operators.

Several methods have been attempted with numerous
15 standards systems as methods for controlling devices on networks comprising a large-scale network system. The International Standards Organization (ISO) has proposed a general-purpose standards framework called the Open System
20 connection (OSI) model. The network control protocol for the OSI model is called the Common Management Information Protocol. The Common Management Information Protocol or CMIP is a common network control protocol from Europe.

Also from the USA, a network management protocol for greater common use is known as Simple Network Management Protocol (SNMP) which is a complete change from the CMIP associated with it. (See "Introduction to TCP/IP Network Management - For Practical Network Control" by M.T. Rose, translated by Takeshi Nishida, First edition Aug. 20. 1992 Toppan.)

This Simple Network Management Protocol has at least one network management station (NMS) in the network management system. Each station has a plurality of management nodes including agents, as well as a network protocol so that the management stations and agents can exchange management information. The user can therefore obtain data on the network and also make changes to this data by utilizing electronic communication (modem) and the agent software for the management node via this network management software on NMS (network management station).

The agent here, refers to the software running as a background process of the target devices. When the user requests management data for equipment on the network, the management software places the object identification information in a management packet frame and sends this object information to the target agent. The agent interprets this object identification information, extracts data

corresponding to this object identification information, places this data back in the packet and sends this packet back to the user. In some cases, a process corresponding to the data that was extracted, may be called up.

5 This agent also maintains data regarding its own status in a data base configuration. This data base is called a Management Information Base (MIB)). Fig. 4 shows a concept view of the MIB configuration. As shown in Fig. 4, the MIB has a tree type data structure and all nodes are affixed with
10 a number. The number inside the parentheses in Fig. 4 is an identifier for that node. For instance, the identifier for node 401 is "1". The identifier for node 402 is a "3" under node 401 and therefore listed as "1.3". In the same way, the identifier for node 403 is listed as "1.3.6.1.2". The
15 identifier for these nodes is known as the object identifier.

The structure of this MIB is called the Structure of Management Information (SMI) and conforms to the "RFC1155 Structure and Identification of Management Information for TCP/IP-based Internets".

20 Only a fraction of the MIB specified as a standard has been extracted and shown in Fig. 4.

In Fig. 4, the numeral 404 is a node representing the peak of the object group and referred to as a standard MIB provided as a standard feature in equipment managed by

Simple Network Management Protocol (SNMP). The detailed structure of the objects ranked below this node are specified in "RFC1213 Management Information Base for Network Management of TCP/IP-based internets: MIB-II. The numeral 5 405 is a node at the peak of the object group called the printer MIB and is provided as a standard item in printers managed by Simple Network Management Protocol (SNMP). The detailed structure of the objects ranked below this node are specified in "RFC1759 Printer MIB. Further, the numeral 406 is referred 10 to as a private MIB and is a peak node for defining autonomous MIB such as used by companies and organizations. The numeral 407 is called a company expansion MIB and is a peak node for autonomous expansion of a company within the private MIB. The Canon Corporation has been assigned "1602" as a company 15 number for definition as an autonomous entity and the peak node 408 for defining Canon MIB which is a Canon autonomous MIB and "408" is ranked at a position below the node 407 which signifies companies. The object identifier "1.3.6.1.4.1.1602" is for the peak node of the Canon MIB.

20 However, on starting up the network management software, and acquiring all the MIB objects controlled by the network management software, a massive quantity of SNMP packets flow through the LAN at nearly the same time. This flow places a large burden on the channels and at the same

time also places an extremely heavy load on the printer and the network boards that process those SNMP packets.

Also, along with this increased load, the startup of the network management software also requires more time
5 (initial menu display) which causes the user to feel stressed.

Further, the network printer management software is constantly writing the MIB data with the same process sequence. Therefore, when the user directs the network
10 printer software to write MIB data, the network printer software of the conventional art constantly writes all of the directed MIB data. However writing all of the MIB data each time is not always necessary and the process is redundant. In other words, the network printer software generally
15 displays a plurality of information for the user simultaneously (information matching the MIB data) and even if the user only rewrites just a fraction of all this information, all of the displayed information of the overwrite is processed as items specified by the user.

20 Among the MIB data specified for rewriting by the user, items for which write is requested from the network management software for SNMP agents on the network printer, represent only the MIB data actually rewritten by the user. There is therefore no need to request write via SNMP agents

on the network printer of MIB data which the user has not rewritten. Not only is such writing unnecessary but reducing the quantity of MIB data subject to write request via SNMP agents on the network printer from the network printer

5 management software is also essential in order to reduce the load (amount of work) assigned to the network traffic (data quantity) and the network printer.

SUMMARY OF THE INVENTION

10

In view of the above circumstances, it is therefore an object of this invention to provide a network data base control device and method thereof which does not simultaneously acquire all MIB object information controlled
15 by the network management software and therefore will have no simultaneous flow of a large volume of SNMP packets, and along with reducing the load on the device channels, the load on devices such as the printer which process the SNMP packets and load on the network board will be small.

20

A further object is to provide a network data base control device and method thereof wherein, by making the load on the LAN, printer and network boards small, the time required to start up (display initial menu) the network

management software will be shortened and the user will thus be provided with an easier operating environment.

Still another object is to provide a network data base control device and method thereof wherein, in network printer management software utilizing the SNMP protocol, no processing change or write requests are made for unnecessary MIB data, while write requests for necessary MIB data for SNMP agents of the device (such as printers) on the network matching write-specified information from the user will be processed, thus allowing the amount of network traffic (data flow rate) and the load (amount of work) applied to the network printer to be reduced.

In order to achieve the above objects, the network device control method of this invention is provided with the following configuration. Namely, a network device control method having;

an initial sheet information acquisition and display step for acquiring and displaying initial sheet information on the initial menu of a device window and the device window is a window for managing and controlling a network device and applicable windows are assigned one each to each network peripheral device and,

a separate initial sheet information acquisition and display for acquiring and displaying applicable separate

00017295 000298
862020 5627060

initial sheet information on a device window when determined that an input from the user is requesting display of sheet information of certain type.

Further, in accordance with the preferred
5 embodiment of this invention, the network printer control program product is provided with the following process steps. In other words, in a network printer control program product having a window for displaying an icon of a list of peripheral network equipment connected to the current network wherein;
10 the network printer control program product is provided with a device window open step for opening windows (hereafter called "device windows") assigned one each to each piece of network peripheral equipment for managing and controlling peripheral network equipment; an initial sheet
15 information acquisition and display step for acquiring information (hereafter called "initial sheet information") for displaying the initial menu of a device window opened in the device window open step; a device window close check step for determining if the user has performed input for
20 closing a device window opened by means of the device window open step; a sheet switch request check step to check if the user has performed input for requesting display of a certain type of sheet information for a device window opened by means of the device window open step after a check reveals by means

and write requests for unnecessary MIB data from among the MIB data matching write information specified from the user in SNMP agents of the network printer.

This invention also is capable of reducing the
5 network traffic (data volume) and reducing the load (work load) applied to the network printer.

Other features and advantages of the present invention will become apparent from the following description taken in conjunction with the accompanying
10 drawings, in which reference characters designate the same or similar parts throughout the Fig.s thereof.

BRIEF DESCRIPTION OF THE DRAWINGS

15 Fig. 1 is a drawing showing network boards for connecting the printers to the network when connected to printers having open style architecture.

Fig. 2 is a cross sectional fragmentary view of the configuration for connecting to the printer, a network
20 board mounted with an agent.

20

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

Hereafter, the embodiment of the invention will be described while referring to the accompanying drawings.

0001295 0624060
A large-scale network requiring management by the embodiment of this invention will first be described.

Fig. 1 shows a network board (NB) for connecting the printer to the network, connected to a printer 102 having an open-style architecture. The NB101 is connected to the local area network (LAN) 100 by for instance an LAN interface such as Ethernet interface 10Base-2 having a coaxial connector or 10 Base-T having RJ-45.

A plurality of personal computers (PC) such as a PC103 or PC104 are also connected to the LAN 100. The PC103 and PC104 can communicate with NB101 within the network operating system. One personal computer such as the PC103 can be directed to function as the network controller. Also, a printer 105 connected to the PC104 can be connected to the PC103.

A file server 106 is connected to the LAN 100. This file server 106 controls access to files stored in a large-capacity (for example 10 billion byte) network disk 107 . A printer server 108 performs printer on the connected printers 109a, 109b or with printer 105 in a remote location, etc. Other peripheral equipment not shown in the drawing may also be connected to the LAN100.

More specifically, the network shown in Fig.1 can utilize network software such as Novell or Unix software for

achieving efficient communications between the various network members. Any network software is capable of being used such as NetWare (commercial trademark of the Novell Company, omitted hereafter). A detailed explanation relating to this software package may be found by referring to the on-line documentation enclosed with the NetWare package. This explanation can also be purchased along with the NetWare package from the Novell Company.

In a simplified description of the layout of Fig.1,
10 a file server 106 fulfills the function of file manager for
receiving data files, storing, queueing, caching and
transmission of data files with the LAN members. For instance,
files made on the PC103 and PC104 are respectively sent to
the file server 106 which sorts these files in order, and
15 in compliance with commands from the print server 108, sends
these ordered data files to the printer 109a.

The data files created on the PC103 and PC104 are sent to the LAN100 and files received from the LAN100 or such kind of files are labeled and processed on a computer conFig.d to perform such tasks. The computer equipment is shown in Fig. 1, however other computer equipment suitable for running the network software may also be included. For instance, when using UNIX software, a UNIX workstation can be incorporated

into the network and under appropriate conditions, can be used along with the computers shown in the Fig..

Usually, a local area network such as the LAN100 provides services to a certain number of local user groups such as on one floor of a building, or a plurality of connected floors in a building. For instance, a wide area network (WAN) can be formed to handle users isolated from other users such as users in other buildings or in other prefectures, etc. The WAN is fundamentally an aggregate consisting of high-speed digital lines such as telephones lines of high-speed digital networks (ISDN) to connect a plurality of LAN. Accordingly, as shown in Fig. 1, the LAN100, LAN110 and LAN120 form WAN connected by modulators/demodulators (modem) and a transponder 130 and a backbone 140. These are simple electrical connections implemented by several bus lines. Each LAN incorporates a custom personal computer. Though not always needed, a file server and a print server are normally incorporated into the LAN.

Therefore, as shown in Fig.1, the LAN110 incorporates a PC111, a PC112, a file server 113, a network disk 114, a print server 115, a printer 116 and a printer 117. In contrast, the LAN120 incorporates only a PC121 and PC122. The equipment connected with the LAN100, LAN110 and

LAN120 can access other LAN equipment functions by means of WAN connections.

Installing agents on network boards

- 5 Agents are installed on network boards for connecting the printer to the network. This process allows the printer to be controlled by the network management software. The user can acquire or change the status of the information for the printer subject to control by the network
- 10 control software. More specifically for instance, the characters shown on the liquid crystal display of a printer can be acquired or the default paper feed cassette changed. Hereafter, a sample connection to a printer, of a network board (NB) mounted with an agent will be described.
- 15 As shown in Fig.2, the NB101 is preferably mounted in the internal expansion slot of the printer 102. The NB101 becomes a "built-in" network node having a data storage function and performing the processing shown below. The structure of this NB101 has the merit of possessing special
- 20 auxiliary functions for integrating and controlling a large multi-area WAN network. These auxiliary functions for instance, include printer control and status monitoring of remote network locations (for instance offices of network coordinators) and automatic control and printer load

characteristics of the printer for providing a guaranteed initial printer environment for the next printer user once the current printing job is finished or may include access through the network for setting a schedule for toner cartridge replacement and incorporating a printer log or statistical records.

An essential element in this NB design is the function for accessing printer control status from NB101 by way of a two-way interface such as the shared memory 200. Besides this shared (or joint) memory, an interface such as an SCSI interface can also be used. Thus, print operation information for a plurality of convenient auxiliary function programs can be sent to the NB101 or to external network nodes. The print image data and control information blocks are formed by a microprocessor 301 on the NB101, listed in the shared memory 200 and then loaded into the printer 102. At the same time, the printer status information is sent from the printer 102 to the shared memory 200 and then loaded by means of the microprocessor 301 on the NB.

Fig. 2 shows a fragmentary view of the NB101 installed in the printer 102. As shown in Fig.2, the NB101 is comprised of a print circuit board 101a installed on a faceplate 101b for making the network connection and connected to the printer interface card 150 by means of the

connector 17. The printer interface card 150 directly controls the printer engine of the printer 102. The printing data and the printer commands are input to the printer interface card 150 by way of the connector 170 from the NB101, while the printer status information is acquired by way of the connector 170 from the printer interface card 170. The NB101 communicates this information to the LAN100 by way of the network connector of the faceplate 101b. At the same time, the printer 102 can also receive printing data from the serial port 102a and the parallel port 102b, etc.

Fig. 3 is a block diagram showing the electrical connections of the NB101, the printer 102 and the LAN100. The NB101 is directly to the LAN100 by way of the LAN interface and connected by way of the printer interface card 150 to the printer 102. The NB101 is comprised of a microprocessor 301 to control the NB101, a ROM 303 to store the operating program for the microprocessor 301, a RAM 302 for utilizing the program run by the microprocessor 301 as work, and a shared memory 200 for exchanging data between the NB101 and the printer interface card 150 and these various components are mutually connected by internal buses. The program used by the NB101 for operating the SNMP agent is stored in the ROM303. The microprocessor 301 performs operation in compliance with the program stored in the ROM303 and utilizes the RAM 302

as the work area. The shared memory 200 is utilized as the buffer zone for communication with printer interface card 150.

The microprocessor 151 on the printer interface card 150 performs data access with the NB101 by way of the shared memory 200 installed in the NB101. The microprocessor 151 of the printer interface card 150 also performs communication with the printer engine 160 for actually moving the printer mechanism.

10 PC Configuration

The configuration of the personal computer operating the network management software is described as follows.

Fig. 5 is a block diagram showing the configuration of the PC capable of being operated by the network management software.

The reference numeral 500 in Fig. 5 denotes the PC operated by the network management software and is equivalent to numeral 103 in Fig. 1. The PC500 is controlled by a network management program executed by a CPU501 supplied with the program from a floppy disk drive (FD) 512 or stored in a ROM 502 or in a hard disk (HD) 511. Devices connected to the system through the system bus 504 are driven by this network management program in a coordinated manner. The

numeral 503 is a RAM which functions as the main memory of CPU 501 or the work area and the like. The numeral 505 denotes a keyboard (KBC) controller for performing control via instructional inputs from a keyboard (KB) 509 and a pointing
5 device not shown in the Fig.. The numeral 506 is a CRT controller (CRTC) which controls the display on the CRT (510). The numeral 507 denotes a disk controller (DKC) which controls access with a floppy disk controller (FD) 512 and a hard disk (HD) 511 for storing boot programs, various
10 applications, edit files, user files and network management programs, etc. The numeral 508 denotes a network interface card (NIC) which performs two-way data exchanges between the agent or the network equipment by way of the LAN100.

One example of a read-out/write method for the MIB
15 data of the network printer management software will be explained while referring to Figs. 159 and 160.

The start of MIB data readout is shown in Step S15900.

In Step S15901, the MIB data readout request is
20 performed for the network printer management software from the SNMP agent of the network printer.

Then in Step S15902, the requested MIB data for the network printer management software from the SNMP agent of the network printer is read-out and reported.

Finally, in Step S15903 the process in Fig. 159 ends.

Next, the MIB data write method in the network printer management software will be explained while
5 referring to the flowchart in Fig. 160.

The start of MIB data write is shown in Step S16000.

In Step S16001, the MIB data write request is performed for the network printer management software from the SNMP agent of the network printer.

10 Then in Step S16002, the requested MIB data for the network printer management software from the SNMP agent of the network printer is written and reported.

Finally, in Step S16003 the process in Fig. 160 ends.

15 However, in writing of MIB data as stated previously, all of the specified MIB data is written and on some occasions, unnecessary data is also written so that a large load is applied in terms of network traffic volume and network printer work.

20 Whereupon, this invention resolves this problem by controlling operation so that only necessary MIB data is changed.

Next, in a large-scale network system such as shown in Fig. 1, a more detailed explanation is given for cases

where network management software operated by a personal computer (hereafter PC) is controlling a device (such as a printer) subject to network management.

Fig. 150 shows the operation when the user starts
5 the network management software and the network management software operation is performed when the desired printer is selected.

First of all, the "START" button is clicked on Windows95 (operating system from Microsoft USA, hereafter
10 omitted) and after selecting "Select and Run File Name", when the file name is chosen and the network management software starts up, a list of all the MIB objects controlled by the network management software is made in Step S15001.

Step S15002 determines if all acquisition of all
15 the object information for the list made in Step S15001 is now complete.

If acquisition of all the object information is complete, then the initial menu of this network management software is displayed and this flowchart ended by means of
20 Step S15003.

If however, acquisition of all the object information in Step S15002 is not complete, then Step S15100 cause the process to return to printer information acquisition in Step S15002.

Step S15100 is explained in detail while referring to Fig. 151.

First, in Step S15101 an inquiry utilizing the SNMP is made to the printer and network board of a portion of the
5 items on the MIB object list made in Step S15001. Upon which, the value of the MIB object list for which inquiry was made, is returned by the SNMP to the network management software operated on the PC.

Step S15102 determines if the SNMP communication
10 is being performed correctly. If communication is not being performed correctly an MIB object inquiry is again made to the printer and the network board utilizing the SNMP. If communication is correct, then the process in this flowchart ends.

15 However, even with the above process, when all the MIB objects controlled by the network management software are acquired, a massive amount of SNMP packets flow through the LAN. Investigation has found that along with a large load placed on the channels, an extremely large load is also placed
20 on the printer and network boards which process these SNMP packets.

In this embodiment therefore, all the MIB objects controlled by this network management software are not acquired. Consequently, there is no simultaneous heavy flow

of SNMP packets through the LAN, and along with reducing the load on the channels, the load placed on the printer and network boards which process these SNMP packets is also reduced.

5

Network Management Software Modular Structure

The configuration of the network management structure will next be described.

The network control device of this embodiment is attained by a PC conFig.d as shown for a network control unit in Fig. 5. The hard disk (HD) 511 stores the network management program performing the main operation of this embodiment as is described later on. In all explanations related from hereon, the CPU501 will serve as the main element of the hardware unless otherwise stated. However, the main item in software control is the network management software stored in the hard disk (HD) 511. The operating system (OS) of this embodiment is assumed to be Windows95 (Microsoft) however the OS need not be restricted to Windows95. The network management program relating to this embodiment may be provided in a form stored on a recording medium such as floppy disks or a CD-ROM, etc. In such a case, a floppy disk controller (FD) 512 such as shown in Fig. 5 or a CD-ROM drive not shown in the drawing may be utilized to load the program

from the recording medium and install the program in the hard disk (HD) 511.

Fig. 6 is a block diagram view of a modular structure of the network management software relating to the embodiment of this invention. This network management software is stored in the hard disk 511 of Fig.5 and the software is run by means of the CPU501. In such cases, the CPU501 uses the RAM 503 as the work area.

The numeral 601 in Fig. 6 denotes the device list module which is a module for displaying on a list, all the devices connected to the network (this list is given in more detail in Fig. 15 as explained later). The numeral 602 denotes the overall control module which serves to coordinate the other modules based on instructions from the device list.

The numeral 603 denotes the configurator which is the module that performs special processing relating to network settings for the agent. The numeral 604 denotes the search module which searches for a device connected to the network. Devices that the module 604 searches for are displayed on a device list 601. The numeral 605 is a network job module for acquiring print job status from the network server by utilizing the NetWare API616. (For details on NetWare API refer for instance, to the "NetWare Programmer's Guide for C" issued by the Novell Company. This text may be purchased

from the Novell Company.) The numerals 606 and 607 denote the UI module for displaying the device window as related later. A UI module is provided for each model displaying detailed information. The numerals 608 and 609 denote the

5 control modules which handle special control of models acquiring detailed information. These control modules, just as with the control modules are provided for each model displaying detailed information. The control A module 608 and the control B module 609 acquire MIB data from the device

10 subject to net control by utilizing the MIB module 610 and then convey this data to the corresponding UI A module 606 or the UI B module 607.

An MIB module 601 performs object identifier and object key conversions. Here, the object key is a 32 bit

15 integer matching the object identifier in a one to one relationship. The object identifier is an identifier of variable length. This variable object identifier is difficult to handle when installed as is in the network management software so the network management software of

20 this document utilizes an object identifier and fixed length identifier internally in a one to one relationship. The host module for the MIB module 610 handles the MIB information utilizing this object key and this arrangement allows easy use in the network management software.

procedure. This NetSpot install procedure is similar to other
 general software installation procedures. Namely, in that
 the user starts up the NetSpot installer on the personal
 computer (PC) and the installer then automatically performs
 5 the install. The installer copies the necessary files from
 the hard disk of the PC and when needed also has the user
 input required information so that the necessary files for
 NetSpot operation are edited or created.

The information entered by the user during this
 10 NetSpot install includes selection of the following two types
 of operating modes (controller mode (administrator mode) and
 general user mode).

NetSpot Operating Mode

NetSpot has the following two types of operating
 15 modes; a controller mode and a general user mode. One of these
 two modes is specified. Basically, the NetSpot install must
 be corrected in order to change the NetSpot operating mode.

Controller Mode (Administrator Mode) : A mode
 utilized by users have specially designated rights (for
 20 instance, the network administrator or network peripheral
 equipment administrator).

General User Mode (User Mode) : A mode utilized
 by a general user having no specially designated rights.

NetSpot Start-Up and Password Approval

When NetSpot is installed in the general user mode, the user can start NetSpot just by executing the NetSpot file. However, when NetSpot is installed in the controller mode, entry of the NetSpot password is requested after the user executes the NetSpot file. The NetSpot cannot start at this time in controller mode, unless the user enters the correct password. In NetSpot controller mode, the user can make all types of network peripheral equipment (device) settings. A mistake in these settings can cause misoperation or equipment breakdowns. So during startup in controller mode in NetSpot, the user is requested to enter the NetSpot password in order to prevent using controller mode by the general user. However, when entry of the NetSpot password is requested, the user can start up NetSpot in the general user mode without entering the password. This process is described in detail later on in the description of the NetSpot password entry dialog box (Fig 10).

During install of NetSpot in controller mode, the user performing the install can set the NetSpot password during controller mode startup.

Further, after the user has started up NetSpot in controller mode, the NetSpot password can be set or changed at controller mode startup. Details are related later on, in the explanation of the NetSpot password change dialog box (Fig. 38).

The NetSpot password which has been set or changed is used from the next time NetSpot is started in controller mode. NetSpot controller mode will start if the NetSpot password entered during controller mode startup matches the actual entry but will not start if the two passwords do not match.

In NetSpot controller mode, instead of requesting the NetSpot password from the user during start-up, a check can be made in the NetWare file server for log-in by the administrator. In other words, during start-up in NetSpot controller mode, the request for entry of the NetSpot can be omitted if the user has previously logged-in to the NetWare file server as the administrator.

In actual network operation, there may be a plurality of administrators in one network environment and the administrator may vary with each piece of network peripheral equipment (device). So in NetSpot controller mode, a device password can be set as an option for each network interface board, in addition to the NetSpot password during

start-up of the controller mode. This allows approval of a device password for each piece of network peripheral equipment selected by the user from the device list display window (Fig. 15) described later on.

5 The controller can set a device password as needed for each network interface board during selection of network peripheral equipment. When a device password has been set in the network interface board, at the time of new selection of network peripheral equipment by the user in NetSpot
10 controller mode from the device list display window (Fig. 15) or in other words when the device window has been opened again, the device password set by the controller for each network interface board is approved.

Entry of the device password during new selection
15 of network peripheral equipment from the device list display window in the NetSpot controller mode can be omitted if the user sets the NetSpot password during controller mode start-up as equivalent to the device password at the time of network peripheral equipment selection.

20 This process is related more specifically, in the explanation for the device password entry dialog box (Fig. 50) and the device password change dialog box (Fig. 137).

In password approval as described above, approval of the device password during the latter selection of network

peripheral equipment is performed by implementing the Canon MIB for the network interface board so this function is not supported for network interface boards not implementing the Canon MIB.

5 NetSpot Exclusive Control

A conflict may possible occur between the network peripheral equipment (device) settings and the network settings, when a plurality of NetSpot controller modes are started up for one piece of network peripheral equipment.

10 Therefore, the number of NetSpot controller modes that can be started versus one piece of peripheral equipment are restricted to one mode. In other words, the same piece of network peripheral equipment cannot be selected by a plurality of NetSpot controller modes. In contrast, a

15 plurality of general user modes can be started for one piece of network peripheral equipment. In other words, the same piece of network peripheral equipment can be selected on more than one NetSpot general user mode.

In the exclusive control in the type of controller

20 mode related above, the network interface boards are implemented by a Canon MIB so this exclusive control function is not supported on network interface boards not implemented by a Canon MIB. When exclusive control is not implemented then network peripheral equipment on the same network can

be selected by more than one NetSpot controller mode just the same as in the NetSpot general user mode.

An illustration demonstrating the concept of exclusive control in the controller mode is shown in Fig.

5 9.

Transition Chart of Windows displayed by NetSpot

Fig.s 7 and 8 are window transition drawings showing in sequence the NetSpot changes in response to user instructions when the user has started NetSpot in controller mode. However, the windows shown in Fig.7 and Fig. 8 do not represent all the windows that NetSpot displays. Even when NetSpot receives no instructions from the user, all types of windows are automatically displayed according to the NetSpot operating status and information acquired from the network. These windows are however explained later on so a description is omitted here. A screen transition view of NetSpot when started in general user mode is omitted and fractional views are shown respectively in Fig. 7 and 8.

The user can monitor the network peripheral equipment status (device) by viewing the information displayed on the respective window shown by NetSpot and can set a suitable value in these windows in order to control the network peripheral equipment (device).

The shared printer environment expansion dialog box 712 shown in Fig. 63, the print adjust set dialog box 713 shown in Fig. 67 and the print operation mode dialog box 714 shown in Fig. 68 are called up from the shared printer environment basic set sheet 711.

The LIPS printer environment expansion dialog box 716 shown in Fig. 70, and the LIPS utility dialog box 717 shown in Fig. 74 are called up from the LIPS print environment set sheet 715.

The N201 print environment expansion 1 set dialog box 719 shown in Fig. 79, N201 print environment expansion 2 set dialog box 720 shown in Fig. 82, and the N201 utility dialog box 721 shown in Fig. 86 are called up from the N201 print environment basic set sheet 718.

The ESC/P print environment expansion 1 set dialog box 723 shown in Fig. 91, the ESC/P print environment expansion 2 set dialog box 724 shown in Fig. 94 and the ESC/P utility dialog box 725 shown in Fig. 98 are called up from the ESC/P print environment basic setting sheet 722.

Next, the printer queue set dialog box 726 shown in Fig. 10 is called up from the job sheet 703, the NetWare dialog box 727 shown in Fig. 34 is called up from the printer queue set dialog box 726. The controller information dialog box 728 shown in Fig. 103 is called up from the information

sheet 704. Finally, the protocol set dialog box 729 shown in Fig. 144 is called up from the network sheet 705.

The protocol set dialog box 729 contains the three sheets consisting of the NetWare setting sheet 730 shown in Fig. 105, the TCP/IP set sheet shown in Fig. 114 and the AppleTalk set sheet 733 shown in Fig. 120. The NetWare dialog box 727 shown in Fig. 34 is called up from the NetWare set sheet 730. The description for the device list window 801 is associated with the description for Fig. 8 and so is apportioned here.

Fig. 8 is a block diagram showing the list of dialog boxes called up from the menus related later, when the NetSpot is started in controller mode.

The numeral 801 in Fig. 8 denotes the device list window shown in Fig. 15. The device list window 801 contains four menus consisting of the device menu 802, display menu 803, setting menu 804 and help menu 805. Among these, the new window device dialog box 806 shown in Fig. 22, the (standard) printer driver install window 807 in the operating system is called up from the device menu 802. Next, the display option dialog box 808 shown in Fig. 29 is called up from the display menu 803. Further, the device search range dialog box 809 shown in Fig. 30, the device display setting dialog box 810 shown in Fig. 31, the device list auto change setting

dialog box 811 shown in Fig. 32, the NetWare log-in dialog box 727 shown in Fig. 34, the NetWare log-out dialog box 813 shown in Fig.36, and the NetSpot password change dialog box 814 for changing the password utilized in running the NetSpot shown in Fig. 38 are called up from the setting menu 804. Finally, the help file window 815 showing the NetSpot help, the NetSpot version information dialog box 816 for displaying the NetSpot version shown in Fig. 42 are called up from the help menu 805.

10 Next, the menu for the device window 701 explained in Fig. 7 is described.

 The device window 701 contains the five menus consisting of : the device menu 817, the display menu 819, the set menu 820, the test menu 821, and the help menu 822.

15 The trap report condition set dialog box 823 shown in Fig. 132, the device display auto change dialog box 824 shown in Fig. 133, the printer information set dialog box 825 shown in Fig. 135, the controller information dialog box 826 shown in Fig. 136, the device password change dialog box 827 shown

20 in Fig. 137 are called up from the setting menu 820. Next, the help file window 828 for showing the NetSpot help, the device version information dialog box 829 shown in Fig. 141 are called up from the help menu 822.

Hereafter a detailed explanation of each of the above mentioned windows as well as a detailed explanation of NetSpot functions associated with each window are given.

NetSpot Password Entry Dialog Box (See Fig. 10)

5 When NetSpot is started in controller mode, the NetSpot password entry dialog box shown in Fig. 10 is displayed only in cases when the NetSpot password has been set. The NetSpot password entry dialog box is a dialog box for the user to enter the NetSpot password at start-up of

10 NetSpot. The NetSpot password entry dialog box does not appear in the NetSpot general user mode. Also, when ON has been selected in "Substitute NetWare server controller password" in the NetSpot password change dialog box (Fig.38), the controller mode then starts up if the user has logged-in

15 as the controller in the NetWare file server so that the NetSpot password entry dialog box does not appear. On the other hand, when the user has not logged-in as the controller in the NetWare file server, the NetSpot password entry dialog box will appear.

20 Detailed Specifications

 Password (P) : A NetSpot password entered by the user in a character string of 0 to 15 spaces.

 User Mode Start (U) : Only valid when OFF is selected here. Large letters and small letters are separated.

User Mode Start (U) : The user selects here whether or not to start in general user mode. The user selects either ON or OFF.

OK button : The user selects this button to enable
5 the current dialog box setting and close the dialog box.

CANCEL button : The user selects this button to disable the current dialog box setting and close the dialog box. (Quits NetSpot)

HELP (H) button : The user selects this button to
10 display the online help.

Other operations : When the user made a mistake in the NetSpot password entry, the message in Fig. 11 is displayed and the NetSpot password entry dialog box is again displayed.

15 NetWare Server Password Entry Dialog Box (See Fig. 12)

When the NetSpot password entry process is complete, a check by NetSpot is made as to whether the user has logged-in to the NetWare file server. If the NetWare
20 server is available for use at this time and if the user has not logged in to the NetWare file server, then the NetWare server password entry dialog box of Fig. 12 is displayed. This NetWare server password entry dialog box is for entry by the user, of the NetWare file server password during

NetSpot start-up, which is required for logging in to the NetWare file server.

Detailed Specifications

5 User Name (U) : The user enters his name here in order to log in to the NetWare file server. When the user has previously logged in to NetWare file server by means of this dialog box, then the user name entered from the previous log-in has been stored.

10 Password (P) : A password entered by the user in order to log-in to the NetWare file server.

NetWare Server (S) : Here, the user selects the NetWare file server that should be logged into. The user makes a selection from the NetWare file servers registered in the bindery.

15 OK button : The user selects this button to enable the current dialog box setting and close the dialog box.

CANCEL button : The user selects this button to disable the current dialog box setting and close the dialog box. (Quits NetSpot)

20 HELP (H) button : The user selects this button to display the online help.

Other operations : When the user made a mistake in the NetWare file server log-in, the message in Fig.13 is

displayed and the NetWare log-in dialog box is again displayed.

When the user selects the "Cancel" button in the NetWare server password entry dialog box, the message of
5 Fig.14 is displayed with a caution note for the user.

Device List Window (See Fig. 15)

The device list window appears as shown in Fig. 15 when the NetSpot start-up process is complete. This device list window is an icon with a list showing network peripheral
10 equipment (devices) connected to the current network.

In controller mode and general user mode, the device list window (of Fig. 15) offers the functions shown in Table 1.

Table 1

List of functions supported by the device list window

ITEM NO.	FUNCTION	Admin	User
1	Display list of devices connected to network <ul style="list-style-type: none"> • Display [Large icon] for each device • Display [Small icon] for each device 	<input type="radio"/>	<input type="radio"/>
2	Display information for each device <ul style="list-style-type: none"> • Display user defined name • Display device product name • Display product name of network interface board • Display MAC address display 	<input type="radio"/>	<input type="radio"/>
3	Display tool bar <ul style="list-style-type: none"> • [Open] tool bar • [Update latest information] tool bar • [Large icon] tool bar • [Small icon] tool bar 	<input type="radio"/>	<input type="radio"/>
4	Display status bar <ul style="list-style-type: none"> • Display number of device 	<input type="radio"/>	<input type="radio"/>

5 The icon design indicates the type of device and device operation status. Devices shown on NetSpot are only network devices implemented for SNMP/Canon-MIB. Network devices other than this cannot be displayed. Devices not connected to the network or devices whose power is off are also not displayed. Further, devices not triggered by network protocol used by NetSpot are also not displayed.

10

A user defined name is also displayed along with the icon showing the device. The Japanese language can also

be used for this user defined name. The user can change the user defined name only in controller mode in the device window (Fig. 43) described later.

The list of devices can be periodically updated
5 and this change in device operating status reflected in the icon by polling the device connection status and operating status at fixed intervals. When a device is newly detected, that device icon is added to the device list.

When there is no response from a device that has
10 been detected up until now and that device window (Fig. 43) did not open, then a red X is displayed on the line connecting to the device icon. Also, when there is no reply from the device after a fixed number of tries, that device icon is deleted.

15 Detailed Specifications (see Fig. 15)

[Open] Tool Bar 1501 : Selection of this by the user opens the device window (Fig. 43) for the device selected by the user. This is only displayed when the menu function [Display] - [Tool bar] menu of the menu function of device
20 list window 801 has been selected. A device that has been selected is only valid when there is no red X mark on the device.

[Update latest information] tool bar 1502 :

Updates the latest information on the device list display

when this item is selected by the user. This is only displayed when the menu function [Display] - [Tool bar] menu of the menu function of device list window 801 has been selected.

[Large Icon] tool bar 1503 : Displays the device
5 list on a large icon when this item is selected by the user. This is only displayed when the menu function [Display] - [Tool bar] menu of the menu function of device list window 801 has been selected.

[Small Icon] tool bar 1504 : Displays the device
10 list on a small icon when this item is selected by the user. This is only displayed when the menu function [Display] - [Tool bar] menu of the menu function of device list window 801 has been selected.

Large icon display : When the [Large Icon] tool
15 bar 1503 is selected, an item specified in the option display dialog box (Fig. 29) is displayed relating to the device display setting dialog box (Fig. 31) along with the large icon. In such a case, items specified from among the large icon, name, device product name, product name for network
20 interface board, and MAC address are displayed. When the device window (Fig. 43) is open in the controller mode, a mark appears on the device icon (Fig. 146). When there is no reply from a previously detected device, a red X is displayed on the line that connects the device icon (Fig.

148). Also, when there is no reply from the device after a fixed number of tries, that device icon is deleted.

Small icon display : When the [Small Icon] tool bar 1504 is selected, an item specified in the option display dialog box (Fig. 29) is displayed relating to the device display setting dialog box (Fig. 31) along with the large icon. In such a case, items specified from among the small icon, name, device product name, product name for network interface board, and MAC address are displayed. When the device window (Fig. 43) is open in the controller mode, a mark appears on the device icon (Fig. 147). When there is no reply from a previously detected device, a red X is displayed on the line that connects the device icon (Fig. 149). Also, when there is no reply from the device after a fixed number of tries, that device icon is deleted.

Status bar display 1505 : Displays the number of displayed devices.

Other operations : The message in Fig. 16 appears when a device is not detected with the opened device window (Fig. 43). The "Chinese" in the message on Fig. 16 is the device name (attached beforehand by the user) for the device which cannot be detected, but is displayed on the device list of Fig. 15. When the user selects the [OK] button in response to the displayed message, along with deleting the icon

Table 2

List (1) of menu functions supported on device windows

ITEM NO.	FUNCTION	Admin	User
1	Device window menu <ul style="list-style-type: none"> • Open selected device window ([Device]-[Open] or [File]-[Open]) • Close selected device window ([Device]-[Close] or [File]-[Close]) • Close all device windows ([Device]-[All Close] or [File]-[All Close]) 	<input type="radio"/>	<input type="radio"/>
2	New device menu <ul style="list-style-type: none"> • Setup new device in device list ([Device]-[Add New]) 	<input type="radio"/>	
3	Printer driver install menu <ul style="list-style-type: none"> • Printer driver install ([Device]-[Printer driver install]) 	<input type="radio"/>	<input type="radio"/>
4	Quit NetSpot <ul style="list-style-type: none"> • ([Device]-[Quit NetSpot] or [File]-[Quit]) 	<input type="radio"/>	<input type="radio"/>
5	Display select menu <ul style="list-style-type: none"> • Select tool bar display ([Display]-[Tool bar]) • Display status bar ([Display]-[Status bar]) • Constant display ([Display]-[Display Near Operator]) • Select large icon ([Display]-[Large icon]) • Select large icon ([Display]-[Small icon]) 	<input type="radio"/>	<input type="radio"/>
6	Icon sequence menu ([Display]-[Icon sequence]) <ul style="list-style-type: none"> • In name sequence • In type sequence • In MAC address sequence 	<input type="radio"/>	<input type="radio"/>

Table 3

List (2) of menu functions supported on device windows

ITEM NO.	FUNCTION	Admin	User
7	latest information display menu · Update icon to latest information ([Display]-[Change To Latest Information])	○	○
8	Option menu ([Display]-[Option...]) · Select item for large icon display · Select item for small icon display · Select chip help display	○	○
9	Protocol select menu · Select protocol for use next time NetSpot starts (NetWare or TCP/IP) ([Set]-[Select protocol])	○	○
10	Error report method menu ([Set]-[Error report method]) · Select error pop-up window display · Select beep tone sound	○	○
11	Device search range menu · Set range of device search (TCP/IP and AppleTalk only) ([Set]-[Device Search Range])	○	○
12	Device display set menu · Select device for display ([Set]-[Device display])	○	○
13	Display auto change set menu · Auto change select and change interval of device list window ([Set]-[Display Auto change...])	○	○
14	NetWare server menu · Log-in to file server ([Set]-[Log-in...]) · Log-out from file server ([Set]-[Log-out...])	○	○
15	Password change menu · Change NetSpot password · ([Set]-[Change NetSpot password])	○	

Table 4

List (3) of menu functions supported on device windows

ITEM NO.	FUNCTION	Admin	User
16	Help menu · Index ([Help])--[Index]) · Search keyword ([Help])--[Search by keyword])	<input type="radio"/>	<input type="radio"/>
17	Version information menu ([Help])--[Version information]) or ([Apple menu])-[For NetSpot]) · NetSpot version · Canon MIB version used by NetSpot · SNMP version used by NetSpot	<input type="radio"/>	<input type="radio"/>

5

Detailed Specifications (See Fig. 15)]

[Device (D)]-[Open (O)] : The user selects this item to open the device window (Fig. 43). The selected device is only valid when no red X mark has been attached to this device.

10

[Device (D)]-[Close (C)] : The user selects this item to close the device window (Fig. 43). In a selected device, and further a device selected with an opened device window (Fig. 43) this is only valid when the device window (Fig. 43) is not already being used (direct operation possible of device window (Fig.43)).

15

[Device (D)]-[All Close (A)] : The user selects this item to close all device windows (Fig. 43). This item

is valid when a device is present in open device window (Fig.43). The device window (Fig. 43) cannot be closed during operation.

[Device (D)]-[Add New (N)] : The device selected
5 by the user is setup and a add new device setting dialog box (Fig. 22) is opened in order to add a device for display. (Controller mode only)

[Device (D)]-[Printer driver install (D)] : The
10 user selects this item to install the printer driver. This calls up the printer menu on the control panel.

[Device(D)]-[Quit NetSpot (X)] : The user selects this item to quit NetSpot.

[Display (V)]-[Tool bar (T)] : The user selects this item to select whether to display the tool bar or not.
15 The user can set either ON or OFF.

[Display (V)]-[Status bar (B)] : The user selects this item to select whether to display the status bar or not. The user can set either ON or OFF.

[Display (V)]-[Display Near Operator(P)] : The
20 user selects this item to constantly display the device list window nearby. The user can set either ON or OFF.

[Display (V)]-[Large icon (G)] : The user selects this item to display large icons on the device list. When

the user sets [Large icon] to ON, the [Small Icon] sets to OFF simultaneously.

[Display (V)]-[Small icon (M)] : The user selects this item to display small icons on the device list. When
5 the user sets [Small icon] to ON, the [Large Icon] sets to OFF simultaneously.

[Display(V)]-[Icon sequence (S)] : The user selects this item to display the devices in sequence. The user selects from "Name Sequence (N)" "Type Sequence (T)"
10 and "MAC Address (M)".

[Display (V)]-[Change To Latest Information (R)] : The user selects this item to change the latest information on the device list display.

[Display (V)]-[Option (O)...] : The user selects
15 this item to open the display option.

[Set (S)]-[Select protocol (P)] : The user selects this item to choose the protocol to operate NetSpot. The user selects from "NetWare"" and "TCP/IP".

[Set(S)]-[Error report method (E)] : The user
20 selects this item to specify the error report method. The user selects either ON or OFF in "Open pop-up window (P)". The user selects either ON or OFF for "Sounding beep tone (B)".

[Set(S)]-[Device Search Range (S)...] : The user selects this item to open the device search range dialog box (Fig.30) in order to specify the search range for the device. The currently used network protocol is only valid for TCP/IP.

5 [Set(S)]-[Device display (V)] : The user selects this item to open the device display set dialog box (Fig.31) in order to specify the device for display from the devices searched for.

10 [Set(S)]-[Display Auto Change (A)...] : The user selects this item to open the device list auto change dialog box (Fig.32) in order to specify the automatic change interval for device list display.

15 [Set(S)]-[Log-in(I)...] : The user selects this item to open the NetWare log-in dialog box (Fig.34) for logging in to the NetWare file server. This function is only valid when the NetWare service is usable.

20 [Set(S)]-[Log-out(O)...] : The user selects this item to open the NetWare log-out dialog box (Fig.36) in order to log out from the NetWare file server. This function is only valid when the NetWare service is usable.

[Set(S)]-[Change NetSpot password (W)...] : The user selects this item to open the NetSpot password change dialog box (Fig.38) in order to change the password at start-up of NetSpot. (Controller mode only)

[Help(H)]--[Index (C)] : The user selects this item to display the index for the NetSpot online help.

[Help] (H))--[Search by keyword (S)...] : The user selects this item to display the NetSpot online help keyword
5 search.

[Help(H)]--[([Version information (A))] : The user selects this item to open the NetSpot version information dialog box (Fig. 42) in order to display the NetSpot version information.

10 Other operations :

When the user changes the operating protocol with [Set (S)]-[Select protocol (P)], the message shown in Fig.17 is displayed advising the user to restart NetSpot if the device window is open in controller mode. When the device
15 window (Fig.43) is open in controller mode, the restart of NetSpot cannot be selected so after the user has closed all device windows (Fig. 43) in controller mode, protocol can again be selected or NetSpot must once again be started after quitting NetSpot.

20 When the user changes the operating protocol with [Set (S)]-[Select protocol (P)], if the device window (Fig.43) is not open in controller mode, the message in Fig. 18 appears advising the user to restart NetSpot. Here, if the user selects the [Yes(Y)] button then NetSpot restarts.

If the user selects the [No(N)] button then the display status returns to the device list window of Fig. 15.

When [Device(D)]-[Quit NetSpot (X)] is selected in controller mode and the device window (Fig.43) is opened in controller mode or an operation is in-progress on the device window (Fig.43) (So that Fig.43 cannot be directly used) then the message in Fig. 19 appears urging the user to quit the operation in all device windows (Fig.43) and to close all controller mode device windows (Fig.43)

When [Device(D)]-[Quit NetSpot (X)] is selected in general user mode and the device window (Fig.43) is opened in controller mode or an operation is in-progress on the device window (Fig.43) (So that Fig.43 cannot be directly used) then the message in Fig. 20 appears urging the user to quit the operation in all device windows (Fig.43) and to close all controller mode device windows (Fig.43)

When the user selects [Device(D)]-[Quit NetSpot (X)] or [File]-[Quit], the message in Fig. 21 appears if it is possible to quit NetSpot. Here, NetSpot is quit if the user selects the [OK] button. If the user selects the [Cancel] button then the display returns to the device list window with no other action performed.

The display on the new device add dialog box may differ according to the network protocol currently used in

the user network environment. Whereupon the following explanation for both (1) NetWare and (2) TCP/IP is given.

(1) Add new device dialog box for NetWare

[Add new device dialog box (1-1) (See Fig. 22)

5 When the currently used network protocol is NetWare, the user can select the device list window (Fig. 15) of the [Device (D)]-[Add New (N)] menu in order to display the add new device dialog box (1-1) shown in Fig.22. When the currently used network protocol is NetWare, this add new
10 device dialog box (1-1) serves as a dialog box allowing the user to select a network interface board for new devices displayed in the device window (Fig.15).

Detailed Specifications

[Network Interface Board (N)] : The user uses this
15 to select the network interface board connected to the add new device. In Fig.22, "EB-1" and "NB-1" are displayed as product names for network interface boards connected to the add new device.

[<Return (B)] button : The user selects this button
20 to return to the device list window (Fig.15) and close the current dialog box (1-1) (Fig. 22) however usually this is disabled (a state where user cannot select this button).

[To Next>] button : The user selects this button to close the current dialog box (1-1) (Fig. 22) after storing

the information displayed in (Fig. 22) in this dialog box (1-1) and display the add new device dialog box (1-2) (Fig.23).

[Cancel] button : The user selects this button to
5 invalidate all settings in the add new device setting and close this dialog box (1-1) (Fig. 22) and return to the device list window (Fig. 15).

[Help(H)] button : The user selects this button to display online help.

10 [Add new device dialog box (1-2) (See Fig.23)]

When the user selects the network interface board per the add new device dialog box (1-1) (See Fig.22) and then selects the [To Next] button, the add new device dialog box (1-2) shown in Fig.23 is displayed. Hereafter, the network
15 interface board mounted in the network printer subject to NetSpot control is called the "NB-1 board". This add new device dialog box (1-2) is a dialog box for specifying the address held by the NB-1 board connected to the new add device displayed in the device list window (Fig. 15) when the
20 currently used network protocol is NetWare. Here, when the user finishes inputting the address and selects the [To Next] button, detection of the device with the specified address is performed. At this time, a display shows the detection

of the device in the add new device dialog box (1-2) (See Fig.23) is in progress.

Detailed Specifications

[MAC address (M)] : The user enters the 12 digit
5 base 16 MAC address here.

[Network No. (N)] : The user enters the 8 digit
base 16 network number here.

[<Return (B)] button : The user selects this button
to close the current dialog box (1-2) (Fig. 23) without saving
10 the information displayed in this dialog box (1-2) (Fig.23)
and to return to the add new device dialog box (1-2) (See
Fig.23). At this time, the display contents of add new device
dialog box (1-1) (See Fig.22) are the previously displayed
contents.

15 [To Next] button : The user selects this button
to close the current dialog box (1-2) (Fig. 23) after saving
the information displayed in this dialog box (1-2) (Fig. 23)
and detecting the device based on this information. The add
new device dialog box (1-2) (See Fig.23) is then displayed.
20 This [To Next] button is only valid when all the digits in
the [MAC address (M)] and the [Network No. (N)] have been
entered.

[Cancel] button : The user selects this button to
invalidate all settings in the add new device setting and

close this dialog box (1-2) (Fig. 23) and return to the device list window (Fig. 15).

[Help(H)] button : The user selects this button to display online help.

5 [Add new device dialog box (1-3) (See Fig.24)]

If the device detection ends correctly in add new device dialog box (1-2) (See Fig.23), then the add new device dialog box (1-3) is displayed. This add new device dialog box (1-3) is a dialog box for the user to set the protocol information of the NB-1 board connected to the new add device shown in the device list window (Fig. 15) when the currently used network protocol is NetWare. Here, when the user completes entry of the protocol information and selects the [To Next] button, the specified protocol information for the NB-1 board is set.

10

15

Detailed Specifications

[NetWare frame type (N)] : The user selects this item to choose the NetWare frame type. The user selects from among : "Invalid" "Auto Detect" "Ethernet II" "Ethernet 802.2" "Ethernet 802.3" and "Ethernet Snap".

20

[Priority (R)] : The user selects this item to choose the frame type to have priority when using auto detection for the NetWare frame type. This is only valid when "Auto Detect" is selected in "NetWare Frame type (N)". The

user selects from among : "Ethernet II" "Ethernet 802.2"
"Ethernet 802.3" and "Ethernet Snap".

[TCP/IP frame type (T)] : The user uses this item
to select the TCP/IP frame type. The user selects from among :
5 "Invalid" and "Ethernet II".

[IP address (A)] : Here, the user enters a base
10×4 item IP address from 0 - 255 digits.

[AppleTalk phase (P)] : The user uses this item
to select AppleTalk phase. The user selects from among :
10 "Invalid" and "Phase2".

[<Return(B)] button : The user selects this item
to close the current dialog box (1-3) (Fig. 24) without saving
the information displayed in this dialog box (1-3) (Fig. 24)
and to return to the add new device dialog box (1-2) (See
15 Fig.23). At this time, the contents of the add new device
dialog box (1-2) (See Fig.23) from the previous display are
retained.

[To Next] button : The user selects this button
to close the current dialog box (1-3) (Fig. 24) after saving
20 the information displayed in this dialog box (1-3) (Fig. 24)
and setting the protocol information for the network
interface board based on this information. The add new device
dialog box (1-4) (See Fig.26) is then displayed.

[Cancel] button : The user selects this button to invalidate all settings in the add new device setting, then close this dialog box (1-3) (Fig. 24) and return to the device list window (Fig. 15).

- 5 [Help(H)] button : The user selects this button to display online help.

Other operations :

- When the user enters a value of 256 or more in [IP address (A)], the message shown in Fig. 25 is displayed and
10 the display returns to add new device dialog box (1-3) (See Fig.24)

[Add new device dialog box (1-4) (See Fig.26)]

- When the setting of protocol information in the add new device dialog box (1-3) (See Fig.24) has ended, the
15 add new device dialog box (1-4) of Fig. 26 is displayed. When the currently used network protocol is NetWare, this add new device dialog box (1-4) serves as a dialog box for the user to set protocol information on the NB-1 board connected to the new add devices displayed in the device list window (Fig.
20 15). In the case of the NB-1 board, when the user selects the [End] button, the network interface board automatically resets and the new settings are now valid.

Detailed Specifications

[<Return (B)] button : The user selects this button to close the current dialog box (1-4) (Fig. 26) and to return to the add new device dialog box (1-3) (See Fig.24). This button is however usually invalid (a state where the user cannot select this button).

[End] button : The user selects this button to close the current dialog box (1-4) (Fig. 26) after resetting the network interface board, and return to the device list window (Fig. 15).

10 [Cancel] button : The user selects this button to close the dialog box (1-4) (Fig. 26) and return to the device list window (Fig. 15) without resetting the network interface board.

[Help (H)] button : The user selects this button to display online help.

[Add new device dialog box (1-5) (See Fig.27)]

If the device detection did not end correctly in the add new device dialog box (1-2) (See Fig.23), then the add new device dialog box (1-5) is displayed. When the currently used network protocol is NetWare, this add new device dialog box (1-5) serves as a dialog box to show that new add devices displayed in the device list window (Fig. 15) connected to the NB-1 port cannot be detected.

Detailed Specifications

[<Return (B)] button : The user selects this button to close the current dialog box (1-5) (Fig. 27) and to return to the add new device dialog box (1-2) (See Fig.23). At this time, the contents of the add new device dialog box (1-2) (Fig.23) from the previous display are retained.

[Close] button : Same function as the [Cancel] button.

[Cancel] button : The user selects this button to close the dialog box (1-5) (Fig. 27) and return to the device list window (Fig. 15) after invalidating all settings relating to the add new device window.

[Help(H)] button : The user selects this button to display online help.

(2) Add new device dialog box when using TCP/IP)

15 [Add new device dialog box (2-1) (See Fig.22)]

When the currently used network protocol is TCP/IP the user can select the device list window (Fig. 15) of the [Device]-[Add New] menu in order to display the add new device dialog box (2-1) shown in Fig.22. When the currently used network protocol is TCP/IP, this add new device dialog box (1-1) serves as a dialog box allowing the user to select a network interface board connected to the new device displayed in the device list window (Fig.15). In the case of TCP/IP,

only devices existing in the same subnet as NetSpot can be added.

Detailed Specifications

[Network Interface Board (N)] : The user uses this
5 to select the network interface board connected to the new device. In Fig.22, "EB-1" and "NB-1" are displayed as product names for network interface boards connected to the add new device.

[<Return (B)] button : The user selects this button
10 to return to the device list window (Fig.15) and close the current dialog box (2-1) (Fig. 22) however usually this is disabled (a state where user cannot select this button).

[To Next>] button : The user selects this button
to close the current dialog box (2-1) (Fig. 22) after storing
15 the information displayed in (Fig. 22) in this dialog box (2-1) and display the add new device dialog box (2-2) (Fig.28).

[Cancel] button : The user selects this button to
invalidate all settings made in the add new device setting,
20 and close this dialog box (2-1) (Fig. 22) and return to the device list window (Fig. 15).

[Help (H)] button : The user selects this button
to display online help.

[Add new device dialog box (2-2) (See Fig.28)]

When the user selects the network interface board per the add new device dialog box (2-1) (See Fig.22) and (here related for when "NB-1" is selected") then selects the [To Next] button, the add new device dialog box (2-2) shown in
5 Fig.28 is displayed.

This add new device dialog box (2-2) is a dialog box for specifying the address held by the NB-1 board connected to the new add device displayed in the device list window (Fig. 15) when the currently used network protocol
10 is TCP/IP. Here, when the user finishes inputting the address and selects the [To Next] button, detection of the device with the specified address is performed. At this time, a display shows that detection of the device in the add new device dialog box (2-2) is in progress.

15 Detailed Specifications

[MAC address (M)] : The user enters the 12 digit base 16 MAC address here.

[IP address (A)] : Here, the user enters a base 10×4 item IP address from 0 - 255 digits. The IP address is
20 entered for setting in a device to be newly added or an IP address that has already been set is entered. The actual search is performed with [MAC address (M)] but search may not be possible if the user does not enter the correct IP address.

[<Return (B)] button : The user selects this button to close the current dialog box (2-2) (Fig. 28) without saving the information displayed in this dialog box (2-2) (Fig.28) and to return to the add new device dialog box (2-1) (See Fig.22). At this time, the display contents of add new device dialog box (2-1) (See Fig.22) are the previously displayed contents.

[To Next] button : The user selects this button to close the current dialog box (2-2) (Fig. 28) after saving the information displayed in this dialog box (2-2) (Fig. 28) and detecting the device based on this information. The add new device dialog box (2-3) (See Fig.24) contents are then displayed. This [To Next] button is only valid when all the digits in the [MAC address (M)] have been entered.

[Cancel] button : The user selects this button to invalidate all settings in the add new device setting and close this dialog box (2-2) (Fig. 28) and return to the device list window (Fig. 15).

[Help(H)] button : The user selects this button to display online help.

Other operations :

When the user enters a value of 256 or more in [IP address (A)], the message shown in Fig. 25 is displayed and

the display returns to the add new device dialog box (2-2) (See Fig.28)

[Add new device dialog box (2-3) (See Fig.24)]

When device detection in the add new device dialog box (2-2) (See Fig.28) has ended correctly, the add new device dialog box (2-3) of Fig. 24 is displayed. When the currently used network protocol is TCP/IP, this add new device dialog box (2-3) serves as a dialog box for the user to set protocol information on the NB-1 board connected to the add new devices displayed in the device list window (Fig. 15). Here, when the user finishes entry of the protocol information, and selects the [TO NEXT] button, the new settings specified by the user as protocol information for the NB-1 board are now valid.

Detailed Specifications

[NetWare frame type (N)] : The user selects this item to choose the NetWare frame type. The user selects from among : "Invalid" "Auto Detect" "Ethernet II" "Ethernet 802.2" "Ethernet 802.3" and "Ethernet Snap".

[Priority(R)] : The user selects this item to choose the frame type to have priority when using auto detection for the NetWare frame type. This is only valid when "Auto Detect" is selected in "NetWare Frame type (N)". The user selects from among : "Ethernet II" "Ethernet 802.2" "Ethernet 802.3" and "Ethernet Snap".

[TCP/IP frame type(T)] : The user uses this item to select the TCP/IP frame type. The user selects from among : "Invalid" and "Ethernet II".

[IP address (A)] : Here, the user enters a base
5 10×4 item IP address from 0 - 255 digits.

[AppleTalk phase (P)] : The user uses this item to select AppleTalk phase. The user selects from among : "Invalid" and "Phase2".

[<Return(B)] button : The user selects this item
10 to close the current dialog box (2-3) (Fig. 24) without saving the information displayed in this dialog box (2-3) (Fig. 24) and to return to the add new device dialog box (2-2) (See Fig.28). At this time, the contents of the add new device dialog box (2-2) (See Fig.28) from the previous display are
15 retained.

[To Next] button : The user selects this button to close the current dialog box (2-3) (Fig. 24) after saving the information displayed in this dialog box (2-3) (Fig. 24) and setting the protocol information for the network
20 interface board based on this information. The add new device dialog box (2-4) (See Fig.26) is then displayed.

[Cancel] button : The user selects this button to invalidate all settings in the add new device setting, then

close this dialog box (2-3) (Fig. 24) and return to the device list window (Fig. 15).

[Help(H)] button : The user selects this button to display online help.

5 Other operations :

When the user enters a value of 256 or more in [IP address (A)], the message shown in Fig. 25 is displayed and the display returns to add new device dialog box (2-3) (See Fig.24)

10 [Add new device dialog box (2-4) (See Fig.26)]

When the setting of protocol information in the add new device dialog box (2-3) (See Fig.24) has ended, the add new device dialog box (2-4) of Fig. 26 is displayed. When the currently used network protocol is TCP/IP, this add new device dialog box (2-4) serves as a dialog box for the user to check protocol information set on the NB-1 board connected to the new add devices displayed in the device list window (Fig. 15). In the case of the NB-1 board, when the user selects the [End] button, the network interface board automatically resets and the new settings are now valid.

15

20

Detailed Specifications

[<Return(B)] button : The user selects this button to close the current dialog box (2-4) (Fig. 26) and to return to the add new device dialog box (2-3) (See Fig.24). This

button is however usually invalid (a state where the user cannot select this button).

[End] button : The user selects this button to close the current dialog box (2-4) (Fig. 26) after resetting
5 the network interface board, and return to the device list window (Fig. 15).

[Cancel] button : The user selects this button to close the dialog box (2-4) (Fig. 26) and return to the device list window (Fig. 15) without resetting the network interface
10 board.

[Help(H)] button : The user selects this button to display online help.

[Add new device dialog box (2-5) (See Fig.27)]

If the device detection did not end correctly in
15 the add new device dialog box (2-2) (See Fig.28), then the add new device dialog box (2-5) is displayed. When the currently used network protocol is TCP/IP, this add new device dialog box (2-5) serves as a dialog box to show that new add devices displayed in the device list window (Fig.
20 15) connected to the NB-1 port cannot be detected.

Detailed Specifications

[<Return(B)] button : The user selects this item to close the current dialog box (2-5) (Fig. 27) and return to the add new device dialog box (2-2) (See Fig.28). At this

time, the contents of the add new device dialog box (2-2) (See Fig.28) from the previous display are retained.

[Close] button : Same function as the [Cancel] button.

- 5 [Cancel] button : The user selects this button to close the dialog box (2-5) (Fig. 27) and return to the device list window (Fig. 15) after invalidating all settings relating to the add new device window.

- [Help(H)] button : The user selects this button
10 to display online help.

[Display option dialog box (See Fig. 29)

- When the user selects [Display]-[Option...] from the device list window (Fig. 15), the option dialog box shown in Fig. 29 is displayed. This is a dialog box to allow the
15 user to select the display options in the device list window (Fig. 15). The printer names added by the user with the printer information set dialog box (Fig. 135) are always displayed in this device list window. When large icons are used, the user can select items besides the name by using the radio
20 buttons. When small icons are used, the user can select items in addition to the name, by using the check box.

Detailed Specifications

[Large Icon] : The user selects this item to display large icons on the device list. In such cases, the

user selects from among : "Name only (N)" "Name & Device
Product Title(R)" "Name & Network Interface Board Product
Title(O)" "Name & MAC Address (A)".

[Small Icon] : The user selects this item to
5 display small icons on the device list. In such cases, the
user selects either ON or OFF for: "Device Product Title (P)"
"Network Interface Board Product Title(B)" and "MAC Address
(M)".

[Tip Help Display(T)] : The user selects whether
10 or not to display the tip help item from the tool bar. The
user selects either ON or OFF.

[OK] button : The user selects this item to
validate the settings and close the dialog box.

[Cancel] button : The user selects this button to
15 invalidate all settings in the add new device setting and
close this dialog box.

[Help(H)] button : The user selects this button
to display online help.

[Device search range dialog box (See Fig.30)]
20 When the user selects the [Set]-[Device search
range...] menu from the device list window (Fig.15), the
device search range dialog box shown in Fig.30 is displayed.
This device search range dialog box is for allowing the user
to set the device search range shown on the device list window

882020" 552/T050

(Fig.15). The settings on the device search range dialog box are only valid when the currently used network protocol is TCP/IP. The user specifies the IP address for the device search or the broadcast address for each subnet as the device search range. When the user does not specify the device search range, a search of the NetSpot's own subnet is made with the broadcast. When a network device does not respond to the specifications of the broadcast of the network interface board, the user must clearly specify the IP address of the device to be searched, in the device list window, as the search range for the device.

Detailed Specifications

[Specify search range] : The user uses this item to select whether or not to specify the search range. The user selects from among : "Do not specify search range (N)" and "Specify search range (S)". When "Do not specify search range (N)" is selected, a search of the NetSpot's own subnet is made with broadcast. When "Specify search range (S)" is selected, the IP address specified with [Search IP address (I)] is searched for.

[Search IP address (I)] : Here, the user enters a base 10×4 item IP address from 0 - 255 digits. The user enters the IP address of the device to be searched or the broadcast address for each subnet. A list of the IP addresses

for search is displayed. The user selects the IP address from the IP address list of devices for search. This operation is only valid when "Specify search range (S)" is selected in [Specify search range].

5 [Add(A)] button : The user selects this item to add the IP address entered by the user, onto the IP address list of devices for search. This operation is only valid when "Specify search range (S)" is selected in [Specify search range] and when [Search IP address (I)] is input.

10 [Delete (D)] button : The user selects this item to delete the IP address selected by the user, from the IP address list of devices for search. This operation is only valid when "Specify search range (S)" is selected in [Specify search range] and when [Search IP address (I)] is input.

15 [OK] button : The user selects this item to validate the settings and close the dialog box.

 [Cancel] button : The user selects this button to invalidate all settings in the add new device setting and close this dialog box.

20 [Help (H)] button : The user selects this button to display online help.

Other operations :

When the user enters a value of 256 or more in [IP address (A)], the message shown in Fig. 25 is displayed and

the display returns to the device search range dialog box
(See Fig.30)

[Device search range dialog box (See Fig.31)]

When the user selects the device list window (Fig.
5 15) of the [Set]-[Device Display] menu, the device dialog
box shown in Fig.31 is displayed. The device display set
dialog box is for allowing the user to set devices for display
in the device list window (Fig.15).

Detailed Specifications

10 [Specify display] : Allows user to select whether
or not to display the device. The user selects from among:
"Display all devices (A)" and "Specify device for display
(T)".

[Devices for display (S)] : Displays a list of
15 devices for display. The user selects a device from among
a list for display. This operation is only valid when user
has selected "Specify device for display (T)" with [Specify
display]. In this case, small icons, names and the MAC address
are displayed.

20 [Do not display (E)] button : The user selects a
device from the list of devices for display and moves this
to the list of devices not for display. This operation is
only valid when the user selects "Specify device for display

(T) " with [Specify display] and then selects the device from the Device for display list.

[Do not display device (I)] : Display a list of devices not for display. The user selects a device from the
5 list of devices not for display. This operation is only valid when the user selects "Specify device for display (T) " with [Specify display] and then selects the device from the Device for display list. In this case, small icons, names and the MAC address are displayed.

10 [For display (W)] : When the user selects this (W) button, the device selected by the user from the Devices not for display list is moved to the Device for display list. This operation is only valid when the user selects "Specify device for display (T) " with [Specify display] and then
15 selects the device from the Devices Not for Display List.

[OK] button : The user selects this item to validate the settings and close the dialog box.

[Cancel] button : The user selects this button to invalidate all settings in the add new device setting and
20 close this dialog box.

[Help (H)] button : The user selects this button to display online help.

[Device List Auto Change Dialog Box (See Fig. 32)]

in Fig. 33 is displayed and the display returns to the device list Device Auto Change dialog box (Fig. 32).

[NetWare Log-In dialog box (See Fig. 34)

When the user selects the [Set]-[Log-In...] menu
5 on the device list window (Fig. 15), the NetWare Log-In dialog box shown in Fig. 34 is displayed. The NetWare Log-In dialog box (Fig. 34) is for allowing the user to access the NetWare file server. This NetWare Log-In dialog box is only operable when the NetWare service is available for use.

10 Detailed Specifications

[User Name (U)] : The user enters the user name here in order to log in to the NetWare file server. When a previous log-in was made to the file server with the dialog box, the previous log-in is stored beforehand as the default
15 user name.

[Password (P)] : The user enters the password here in order to log in to the NetWare file server.

[NetWare server (S)] : The user selects the NetWare file server for log-in with this item. The user selects the
20 NetWare file server from the registrations in the bindery.

[OK] button : The user selects this item to validate the settings and close the dialog box.

[Cancel] button : The user selects this button to invalidate all settings in the add new device setting and close this dialog box.

[Help (H)] button : The user selects this button to display online help.

Other operations :

When the log-in to the NetWare file server fails, the message in Fig. 35 is displayed and the display returns to the NetWare log-in dialog box (Fig. 34).

[NetWare Log-In dialog box (See Fig. 36)]

When the user selects the [Set]-[Log-In...] menu on the device list window (Fig. 15), the NetWare Log-Out dialog box shown in Fig. 36 is displayed. The NetWare Log-Out dialog box (Fig. 36) is for allowing the user to log out from the NetWare file server. This NetWare Log-Out dialog box (Fig.36) is only operable when the NetWare service is available for use.

Detailed Specifications

[NetWare server during log-in (S)] : This is a list displaying the currently logged-in NetWare file servers. The user selects the NetWare file server from the list of currently logged-in NetWare file servers.

[Log-out (O)] button : The user selects this [Log-out (O)] button to log out of the NetWare file server

selected with [NetWare server during log-in (S)]. This function is only valid when the user has selected the NetWare file server with [NetWare server during log-in (S)].

[Cancel] button : The user selects this button to
5 invalidate all settings in the add new device setting and close this dialog box.

[Help (H)] button : The user selects this button to display online help.

Other operations :

10 When the user selects the [Log-out (O)] button, the message shown in Fig. 37 appears. When the user selects the [Yes (Y)] button, log-out from the specified NetWare file server is performed, and the display returns to the device list window (Fig. 15). When the user selects the [No (N)]
15 button, the device list window (Fig. 15) returns with no other action performed.

[NetSpot Password Change Dialog Box (See Fig. 38)]

When the user selects the [Set]-[NetSpot password change...] menu on the device list window (Fig. 15), the
20 NetSpot Password Change dialog box shown in Fig. 38 is displayed. The NetSpot Password Change dialog box (Fig. 38) is for allowing the user to change the NetSpot password entered by the user during start-up of NetSpot in controller

mode. The NetWare Password Change dialog box (Fig. 38) is only operable in controller mode.

Detailed Specifications

[Old password(O)] : The user enters here a
5 character string of 0 to 15 digits used as the old NetSpot password during NetSpot start-up. This is grouped into upper or lower case letters.

[New password(N)] : The user enters here a
character string of 0 to 15 digits used as the new NetSpot
10 password during NetSpot start-up. This is grouped into upper or lower case letters.

[New password check entry (F)] : The user re-enters
here a character string of 0 to 15 digits used as the new
NetSpot password during NetSpot start-up. This is grouped
15 into upper or lower case letters.

[Substitute NetWare server controller password
(S)] : The user selects this item in order to check whether
or not log-in to the NetWare file server has been made as
a controller, instead of the user entering the NetSpot
20 password at start-up of NetSpot. This is allowable when the same specifications are also set for the device password. This function is only operable when the NetWare service is usable. The user selects ON or OFF for this function.

Version Information Dialog Box of Fig. 42. This NetSpot Version Information Dialog Box of Fig. 42 is for displaying the NetSpot version information.

Detailed Specifications

- 5 [Version Info] : This displays the NetSpot title and version. The copyright is displayed. The Canon-MIB used by NetSpot is displayed. The SNMP version used by NetSpot is displayed.

- 10 [OK] button : The user selects this item to validate the settings and close the dialog box.

[Device Window (See Fig. 43)]

- 15 The user double-clicks an icon displayed on the device list window (Fig. 15) to display the Device Window Dialog Box shown in Fig. 43. The number of device windows (Fig. 43) that can be opened by the user is limited to one for each device. The user clicks the tabs ([Status] [Job] [Info] and [Network] on the left side of the Device Window (Fig.43) to move the sheet for each tab to the leading edge of the Device Window (Fig. 43).

- 20 Hereafter, the process from selecting the device from a Device List Window 801 (Fig. 15) and displaying a device window 701 (Fig.43) is described while referring to the flowchart.

First Embodiment

Next, a first embodiment for display that will not cause the user stress is explained from the device list window 801 to the device window 701.

In Fig. 152, the flowchart shows the device window display operation for the network controller software (NetSpot) that the user is currently starting up.

The NetSpot program executed according to this flowchart is stored in a hard disk (HD) 511. A CPU501 is the main hardware element in running this NetSpot program.

10 However, the main control element for the software is the NetSpot stored in the hard disk (HD) 511. In this embodiment, the operating system (OS) is assumed to be Windows95 however the OS is not limited to this.

A device window 701 shown in Fig. 7 opens when the user double-clicks the icon showing the device in Step S15201 in the NetSpot program. This device window 701 is shown on the CRT display of CRT 510 by way of the CRT controller 506 by way of the PC500. However, at the completion of Step 15201, only the device window frame and the sheets for the status, job, information and network are displayed and there is no display of printer information on a sheet as shown in Fig. 43.

15

20

Next, in Step S15300, the initially displayed sheet information is acquired and shown.

Executing NetSpot in this step, completes acquisition of printer information on the initially displayed sheet in the device window 701 and as shown in Fig. 43, a display of the printer information on a sheet is possible.

5 In Fig. 43, an example of the sheet showing the initial status sheet is shown but the job sheet, information sheet or network sheet may be shown. However, the job sheet as related later on, is provided by utilizing the NetWare service so that when acquiring printer information by means of the Step S15300,
10 SNMP is not used.

The latter process of this step is explained in detail next.

When Step S15300 is executed and the initial sheet of the device window 701 is displayed, NetSpot implements
15 Step S15202 and monitoring is performed to determine whether there was a request from the user to close the device window 701.

Here, if the user selects "Close" from the device menu 817 of Fig.8, when the user clicks the X mark at the
20 upper right of the device window 701 of Fig. 43; NetSpot closes the device window 701 by means of Step S15204 and the flowchart then ends.

If the user does not perform the operation needed to close the device window 701, then the process moves to Step S15204.

In Step S15204, NetSpot performs monitoring to
5 check for a request from the user to select a new (separate) sheet.

Here, if the user selects [Status] [Job] [Info] [Network] from the displayed menu 819 in Fig. 8, when one of the tabs ([Status] [Job] [Info] [Network]) is clicked on
10 the device window 701 of Fig. 43, then NetSpot implements the Step S15400 and newly selected sheet information is acquired and displayed.

If, the user did not select a new sheet, the CPU returns control to the Step S15202 and control of the process
15 as described above is repeated.

The above explanation and flowchart described display of the device window 701 by means of the user selecting a device from the device list window 801; and if no longer needed, closing the device window 701.

20 Next, the operation of the Step S15300 is described by utilizing the flowchart in Fig. 153.

In this flowchart, the process for acquiring and displaying the sheet for initial display is shown.

First of all, in Step S1530 the sheet for initial display is specified. This step utilizes a status sheet 702 as the sheet for initial display but in NetSpot any of the [Status] [Job] [Info] [Network] sheets can be specified for
5 initial display.

Here, a variety of methods are available for specifying the first sheet for display from among the above mentioned four types of sheets.

These methods are listed below.

10 (1) Incorporating specification of initial file into the NetSpot program beforehand.

(2) The user specifies the initial file. NetSpot acquires the sheet name for initial display from the prior initialization file at program execution.

15 (3) The sheet name last displayed when NetSpot was previously used is retained in the prior initialization (reset) file. Next, the sheet name for initial display is acquired from the prior initialization (reset) file at execution of the NetSpot program.

20 (4) An item such as "Initialize display sheet select window" is displayed at execution of the NetSpot program and the user then specifies the initialization (reset) display sheet.

(5) More than one MIB object are acquired beforehand, and when a problem object is discovered, the information for that object is set as the sheet for initial display.

5 After determining the sheet for initial display by means of the Step S15301, NetSpot forms a list of MIB object required for display of the sheet by means of the Step S15302. Hereafter, this sheet is called the Sheet Information List.

10 Finally, NetSpot implements the Step S15500 and the process of this flowchart ends.

Next, the operation of the Step S15400 is described while referring to the flowchart in Fig. 154.

This flowchart performs the acquisition and display of newly selected sheet information by the user.

15 First of all, in the Step S15401, NetSpot determines again the sheet for display in accordance with the user's entry. Here, as the user entry, selection of the [Status] [Job] [Info] [Network] from the display menu of Fig. 8 or clicking of a tab of tabs ([Status] [Job] [Info] [Network]) at the left side of the device window 701 of Fig. 43.

20

After determining the sheet for initial display by means of the Step S15401, NetSpot forms the Sheet Information List by means of the Step S15402.

Finally, NetSpot implements the Step S15500 and the process of this flowchart ends.

Next, the operation of the Step S15500 is described while referring to the flowchart in Fig. 155.

5 This flowchart is a modified version of the flowchart in Fig. 2 so aside from the operation for acquisition of printer information, timer processing for auto change, and cache processing for improving image display speed are utilized.

10 First of all, whether or not to automatically acquire sheet information is determined in the Step S15501.

 Here, "Auto Acquisition" is the process for acquiring printer information by means of SNMP without using the cache related later.

15 The criteria for performing auto acquisition or not is "Is this first time for this sheet" in the Step S15501. NetSpot erects a "Display Over" flag for a sheet that has been opened once so the criteria in the Step S15501 is whether the "Display Over" flag has been erected or not.

20 If auto acquisition is not performed in the Step S15501 (in other words if the "Display Over" flag has been erected) then the process proceeds to the Step S15600.

 The operation of the Step S15600 is described while referring to the flowchart of Fig. 156.

First of all, in the Step S15601, whether to examine all the Sheet Information Lists or not is determined.

At this point, if an examination of all elements of the Sheet Information list is finished, then the process
5 of this flowchart ends.

The process then proceeds to Step S15602 if examination of all elements is not finished.

In the Step S15602 whether or not the elements of the cache values currently being examined on the sheet
10 information list are valid is checked.

This "Cache value" is explained later on while referring to Fig. 155.

If the cache value is not valid, the process returns to Step S15601 with no other processing performed.

15 If the cache value is valid, then NetSpot displays the cache value with device window 701 in Step S15603.

Next, in Step 15604, after acquiring the acquisition status of elements in the above Step 15603, the process returns to Step 15601.

20 The explanation of the Step S15600 is now complete.

NetSpot implements Step S15502 when "YES" is selected in Step S15501 if the above Step S15600 is complete.

In Step S15502, NetSpot determines whether or not acquisition of any elements is not complete in the sheet information list.

If some elements are present whose acquisition is
5 not complete, the printer information is acquired by means of the previously related Step S15100.

Next, in the Step S15503, a check is made as to whether or not the information acquired in the above Step S15100 is already retained as a cache value in the RAM503
10 of Fig. 5.

Here, "cache" refers to printer information items acquired at least once and held in the RAM503 of Fig. 5. The "cache value" is that value.

Utilizing the "cache" allows the load on the
15 printer 102, the network board 102 and the LAN100 to be held to a minimum amount.

If the cache value is not held in the RAM503 in the Step S15503, then the process proceeds to the Step S15505.

If the cache value is held in the RAM503 in the
20 Step S15503, then the process proceeds to the Step S15504.

In Step S15504, a check is made as to whether the value of the information acquired in Step S15100 is the same as the cache value held in the RAM503.

If, in Step S15100, the value of the information acquired in Step S15100 is the same as the cache value held in the RAM503, then the process proceeds to Step 15506.

If, however in Step S15100, the value of the
5 information acquired in Step S15100 is different from the cache value held in the RAM503, then the process proceeds to Step 15505.

In Step S1505, NetSpot retains the information acquired in the Step S15100 as a new cache value in the RAM503.

10 Next, in Step S15506, the cache value retained in the RAM503 is displayed on the device window 701. The display is shown on the CRT510 by way of the CRT controller 506 of Fig.5.

When the Step S15506 ends, NetSpot implements Step
15 S15507.

In Step S15507, acquisition of currently processed element from the sheet information list is completed.

In the above explanation, the RAM503 was set at the location to retain the cache however this location can
20 be substituted with the HD511.

When Step S15507 ends, NetSpot returns to Step 15502 and Steps S15502 through Steps S15507 repeat until all information from the sheet information list is acquired.

In Step S15502, if all element from the sheet information list are acquired, then NetSpot implements Step 15508.

In Step S15508, the printer status which
5 occasionally changes over time is monitored and a decision made whether or not to automatically update the currently specified sheet information.

A plurality of methods are available for specifying whether or not to automatically update sheet
10 information, two are listed below as examples.

(1) Set whether or not to automatically update, into the NetSpot program beforehand.

(2) The user specifies with the initialize file whether or not to automatically update sheet information.

15 During program execution, NetSpot acquires information as to whether or not to automatically update from the initialize (reset) file.

Should the method in (2) be utilized, the user can set whether or not to automatically update (change) and the
20 automatic change interval by means of the device display auto change dialog box 824 shown in Fig. 133.

If, in Step S15508, auto change is set then the process proceeds to Step S15509.

If auto change is not set then the flowchart ends.

5 Next, in Step S15510, a check is made as to whether
the auto change time set in Step S15509 has now turned off.

If the auto timer has now turned off, then the process returns to Step S15502 for acquisition of information selected again by the current user.

10 If the auto timer has not turned off, then the
process proceeds to Step S15511.

In Step S15511, the user monitors whether auto change has stopped or not. For instance, NetSpot stops the auto change timer when the user switches the sheet display.

15 If auto change (update) has not stopped, the
process returns to Step S15510 and the Steps S15510 and S15511
are repeated.

If auto change has stopped then this flowchart ends.

20 Also, the flowchart shown in Step S15500 can be
implemented as shown in Fig. 157.

Hereafter, Step S15500 is explained based on the flowchart of Fig. 157.

Hereafter a working example in the second embodiment is given for displaying the device list window 701 from the device window 801 to prevent the user from feeling stress due to delays in operation.

5 In Fig. 158, the process in the flowchart starts by the user operating the device window for the network management software (NetSpot) during the current start-up.

10 The NetSpot program executed according to this flowchart is stored in a hard disk (HD) 511. A CPU501 is the main hardware element in running this NetSpot program. However, the main control element for the software is the NetSpot stored in the hard disk (HD) 511. In this embodiment, the operating system (OS) is assumed to be Windows95 (Microsoft Corporation) however the OS is not limited to
15 this.

When the user double-clicks the icons displaying the devices, the device window 701 shown in Fig. 7 is opened in Step S15801. In this step, operation is completely the same as in Step S15201 of the first embodiment.

20 Next, NetSpot implements Step S15300, the initial sheet information is acquired and displayed on the device window 701.

Next, NetSpot implements Step S15802.

After the initial sheet is displayed, the Step S15802 is for NetSpot to make sheet information sheet for other sheets in order to acquire other sheet information as background.

- 5 Next, in Step S15803, determines the sheet to acquire of the sheet information list from among the sheet information lists formed in the above Step S15802.

- 10 If restrictions are not placed on the acquisition procedure for sheet information, for instance, if listed in the initialize file or determined at random, then this method will be fixed within the NetSpot program.

Next, Step 15804 and Step 15805 are exactly the same as Steps S15202 and Steps 15203 of the first embodiment so their description is omitted here.

- 15 Further, Step 15806 is the same as Step 15204 but when the user has not made entry for another sheet selection, the process differs by proceeding to Step 15807.

- 20 Next, in Step S15807, NetSpot checks whether or not acquisition of all information for other sheet information lists formed in Steps S15802 is complete.

If acquisition of all information is complete, the process proceeds to Step S15804 and the process repeats from Step S15804 to S15807 as well as S15400.

When canceling controller registration onto the manager information table, and time is required for canceling controller registration on the manager information table for the device selected by the user; then the message in Fig.45
5 appears and the fact that the controller registration is currently being canceled is reported to the user.

In cases where first displaying a sheet - dialog box on the device window (Fig. 43), and time is required for acquiring information from the device selected by the user,
10 then the fact that information is currently being acquired is reported to the user and when information acquisition is capable of being canceled, the [STOP] is valid.

When time is required for setting information to the device selected by the user, in sheet - dialog box on
15 the device window (Fig. 43), then the message in Fig.47 appears and the fact that information is currently being set is reported to the user. When this setting of information can be canceled, the [STOP] is valid.

Further, during reset of the printer or reset of
20 the network interface board, and time is required for reset of the device selected by the user, the message in Fig. 48 appears and the user is informed that reset is in progress. When implementing commands other than printer reset or network interface board reset and time is required for

Detailed Specifications

[Password (P)] : The user enters a device password here in a character string of 0 to 15 spaces. This function is only valid when the user has not selected ON in [Open in User Mode (U)]. Classified separately by large letters and small letters.

[Open in User Mode (U)] : The user selects in general user mode whether to open the device window (Fig. 43). The user selects either ON or OFF.

```
10      [OK] button : The user selects this item to
      validate the settings and close the dialog box.
```

[Cancel] button : The user selects this button to invalidate all settings in the add new device setting and close this dialog box.

```

15          [Help (H)] button : The user selects this button
to display online help.

```

Other operations :

When the user makes a mistake in entering the device password, the message in Fig. 51 appears and the display returns to the Device Password Entry Dialog Box (Fig. 50).

During registration onto the manager information table when the user has selected a device; and it is detected that the device window selected by the user (Fig.43) is

already open by means of NetSpot controller mode at another computer terminal, then the message in Fig. 53 appears. Here, when the user selects the [YES(Y)] button, the device window (Fig.43) is automatically opened in controller mode. When
5 the user selects the [NO(N)] button, the device window (Fig.43) does not open in controller mode. Upon detecting that the device window (Fig.43) for a device selected by a user was already opened in NetSpot controller mode by another computer terminal; and when the user did not select
10 automatically opening the device window (Fig.43) in controller mode, then the message in Fig. 53 appears. Here, when the user selects the [YES(Y)] button, the device window (Fig.43) is opened in general user mode. The situation on the device window for user mode is shown in Fig. 145. On the
15 device window (Fig. 145) of user mode, a comparison is made with the device window (Fig. 43) of controller mode, the network sheet and printer set button are canceled, and the setting operation disabled as can be seen just by checking printer related information.

20 When the user selects the [NO(N)] button, in the situation shown by the message in Fig. 53, the display returns to the device list window (Fig. 15) without performing any other functions.

[Status Sheet (See Fig.54)]

The Status Sheet shown in Fig. 54 appears when the user double-clicks the left side [Status] of the device window (Fig. 43) or appears as a default sheet on the leading edge when the user opens the device window (Fig. 43). This
5 status sheet (Fig. 54) is for displaying the current status for devices selected by the user. Table 5 shows functions provided by the Status Sheet (Fig 54) in the controller mode and in general user mode,

0901235 000000

Table 5

List of functions supported on status sheet (Fig. 54)

ITEM NO.	FUNCTION	Admin	User
1	Bitmap display of printer exterior · Unit design · Paper feed section design (equipment info.) · Paper eject section design (equipment info.) · Unit internal design per abnormal section (only in abnormality) · Cover design (only in abnormality)	○	○
2	Operating panel status display · Display contents · Online key LED status display	○	○
3	Paper feed section status display · Paper feed section types · Paper feed selected by user · Paper size · Remaining paper	○	○
4	Error information display · Count of currently occurring errors · List of error information of all occurring errors (only when error occurs) · Position where error occurred (only when error occurs)	○	○
5	Online help display for errors · Online help showing error message	○	○
6	Restoring operation after error · Select printer paper feed/eject · Operate online help · Operate soft reset for printer	○	

5

The "Bitmap display of printer exterior" is a bitmap displaying the design of the printer unit. Switching

to paper feed sections or paper eject section can be performed according to the option that is installed. When trouble occurs, a symbol indicating an error is displayed. The "Operating panel status display" shows display contents reported by the printer and also performs polling of operating panel status at fixed intervals to periodically update the operating panel status display.

When in "sleep" during an auto energy-saving function, the sleep condition is shown on the operating panel display. The "Error Info" button becomes active when an error including a warning level occurs. When in status where an error is not occurring, the "Error Info" button is inactive. The "Online help display for errors" and the "Restoring operation after error" are shown on Error Information Display Dialog Boxes by pressing the "Error Info" button.

Detailed Specifications

[Online LED] : Displays the status of the online LED. Display ON (green) and OFF (black).

[Display] : Displays the message and status in two lines of 16 characters each. During sleep status displays "Sleep".

[Printer Exterior] : Display the printer exterior. The printer exterior design may change according to the paper deck, envelope feeder, and steplestacker options that are

installed. However option installations such as the dual-side unit, network interface board, expansion RAM, font ROM and control ROM do not affect the printer exterior design. When an error occurs in the printer unit (excluding warning
5 level) a symbol mark indicating an error in the printer exterior design is displayed. A red "O" mark is affixed to the location of the error when discovered.

[Paper Feed section] : Displays the names of the paper feed section. Displays "Paper feed tray" "Upper
10 cassette" "Lower cassette" "Paper Deck" and "Envelope Feeder". When not in auto paper feed, a check mark is displayed at the paper feed section selected by the user. A check mark is displayed at the feed section targeted for auto feed. The "Paper deck" and the "Envelope Feeder" are only valid when
15 their respective options have been installed.

[Paper size] : Displays the paper sizes of each paper feed section. Displays "A5" "B5" "A4(R)" "B4" "A3" "Letter(R)" "Legal" "Executive" "Free" "User paper" "YOGATA 4GO" "KAKUGATA 2GO". The "YOGATA 4GO" and "KAKUGATA 2GO"
20 indicate envelope sizes uniquely used in Japan.

[Remaining Paper] : Displays the remaining amount of paper for each feed section. In the case of the paper feed tray and envelope feeder, display is available in two stages

"YES" and "NONE". In the case of a cassette, displays in five stages of "0%" "25%" "50%" "75%" and "100%".

[Eject Paper Info (O)] button : Opens the eject section information dialog box for displaying information
5 on the eject section.

[Error Count] : Displays a count of errors currently occurring. The error count also includes warning level errors.

[Error Info (E)] button : The user selects this
10 button to open the error information dialog box in order to display information on errors. This function is only valid when the [Error Count] is greater than one.

[Printer Set (P)] button : The user selects this button to open the printer environment dialog box (controller
15 mode only) in order to set the printer environment.

[Help] button : Displays online help.

[Error Information Dialog Box (See Fig. 55)]

When the user selects the [Error Info] button on the Status sheet (Fig. 54), the Error Information Dialog Box
20 shown in Fig. 55 is displayed. The Error Information Dialog Box (Fig. 55) is for displaying detailed information on a plurality of errors currently occurring in the device selected by the user. The Error Information Dialog Box (Fig.55) is only applicable to error occurring and includes

warning level errors. When a plurality of errors occur at the same time, the errors are displayed in order of high priority.

In errors occurring in controller mode, error skip
5 and print stop can be implemented. The error skip operation is equivalent to skipping over the error and is performed when the user presses the paper feed/eject key on the printer operating panel or presses the online key. The print stop operation is equivalent to halting the printing and is
10 performed by the user pressing the reset (soft) key on the printer operating panel.

The error skip and the print stop functions may not be valid according to the type of error that occurs. Therefore, the user must choose the correct operation: error
15 skip or print stop according to the error that occurs.

Detailed Specifications

[Printer Exterior] : Display the printer exterior.

The printer exterior design may change according to the paper deck, envelope feeder, and steeplestacker options that are
20 installed. However option installation such as the dual-side unit, network interface board, expansion RAM, font ROM and control ROM do not affect the printer exterior design. When an error occurs in the printer unit (excluding warning level) a symbol mark indicating an error in the printer

Dialog Box (Fig. 55) with no other operations being performed.

[Printer Paper Feed/Eject Dialog Box (See Fig. 57)]

5 The Printer Paper Feed/Eject Dialog Box shown in Fig. 57 is displayed when the user selects the [Feed/Eject Paper] button on the Error Information Dialog Box (Fig. 55). This Printer Paper Feed/Eject Dialog Box (Fig. 57) is for allowing the user to select paper feed or eject of the device
10 selected by the user and is only applicable in controller mode.

Detailed Specifications

[Paper Feed section] : The user selects the paper feed section. The user selects from among "Auto(U)" "Paper feed tray(I)" "Upper cassette(C)" "Lower cassette(S)" "Paper
15 Deck(P)" and "Envelope Feeder(V)". The "Paper Deck(P)" and "Envelope Feeder(V)" are only available when each are provided as options. The paper size for each paper feed section is displayed. Displays "A5" "B5" "A4(R)" "B4" "A3"
20 "Letter(R)" "Legal" "Executive" "Free" "User paper" "YOGATA 4GO" "KAKUGATA 2GO". The remaining amount of paper for each feed section is also displayed. In the case of the paper feed tray and envelope feeder, display is available in two stages

"YES" and "NONE". In the case of a cassette, displays in five stages of "0%" "25%" "50%" "75%" and "100%".

[Paper Eject Section] : The user selects the paper eject section here. The user selects from among "Eject tray (O)" and "Eject Subtray (B)" when the not equipped with the staple stacker option.

[OK] button : The user selects this button to validate the settings that were entered and to close the dialog box. The printer settings are updated at this time.

[Cancel] button : The user selects this button to invalidate the settings that were made and close the dialog box.

[Update(A)] button : The user selects this button to update the printer settings.

[Help (H)] button : The user selects this button to display the online help.

[Printer Environment Dialog Box (See Fig. 143)]

The Printer Environment Dialog Box shown in Fig. 143 appears when the user selects the [Printer Set] button of the Status sheet (Fig. 54). This Printer Environment Dialog Box is for making printer environmental settings for the device selected by the user. The Printer Environment Dialog Box is basically comprised of five sheets with tabs as follows.

- (1) Printer paper feed/eject basic sheet (Fig. 58)
- (2) Shared print environment basic sheet (Fig. 59)
- (3) LIPS print environment basic sheet (Fig. 69)
- (4) N201 print environment basic sheet (Fig. 76)
- 5 (4) ESC/P print environment basic sheet (Fig. 88)

When the print environment dialog box is opened by the user, the foremost sheet shown is the default sheet which is the printer paper feed/eject basic sheet (Fig. 58). As a typical view, the Printer Environment Dialog Box shown
10 as a common (shared) sheet is displayed in Fig. 143.

When the user clicks one of the [Feed/Eject Paper] [Shared] [LIPS] [N201] [ESC/P] tabs on the upper part of the Printer Environment Dialog Box, the sheet corresponding to that tab, moves to the foremost place on the Printer Environment Dialog
15 Box. This Printer Environment Dialog Box is only applicable in the controller mode. In controller mode, the functions indicated in Tables 6 through Table 11 are provided. A portion of the functions listed below are settings that accompany some manner of operation of the printer unit.

Table 6
Functions (List 1) supported on the
printer environment dialog box

ITEM NO.	FUNCTION	Admin	User
1	Printer feed eject section setting • Printer exterior bitmap display • Feed selector • Auto feed selector • Tray priority selector • Tray paper size selector • Envelope size selector • Eject paper selector	○	
2	Shared printer environment basic settings • Copy sheet count • Super smooth selector • Toner economy mode • Toner contrast • Data processing resolution • Double-side mode • Binding width • Binding direction	○

[Printer Feed/Eject Section Sheet (See Fig. 58)]

When the user selects the [Print Set] button on the Status sheet (Fig. 54) or clicks the tab shown as [Feed/Eject] on the upper part of the printer environment dialog box, the foremost sheet shown is the default sheet which is the Printer Paper Feed/Eject Sheet (Fig. 58). This Printer Paper Feed/Eject Sheet is for the user to make printer paper feed/eject settings for the device selected by the user.

10 Detailed Specifications

[Printer Exterior] : Display the printer exterior.

The printer exterior design may change according to the paper deck, envelope feeder, and steeple stacker options that are installed. However option installations such as the dual-side unit, network interface board, expansion RAM, font ROM and control ROM do not affect the printer exterior design. When the user makes a selection other than "Auto" in [Paper Feed (I)], a color is affixed to the feed section selected in [Paper Feed (I)]. When the user does make a selection from "Auto" in [Paper Feed (I)], a color is affixed to the feed section selected in [Auto Feed (K)]. A color is also assigned to the eject section selected by the user with [Paper Eject(O)].

[Paper Feed section (I)] : Displays the names of the paper feed section for selection by the user. The user makes a selection from among "Auto" "Paper feed tray" "Envelope feeder" "Upper cassette" "Lower cassette" and
 5 "Paper Deck". The "Paper deck" and the "Envelope Feeder" are only valid when installed as options.

[Auto Feed (K)] : Selects auto feed for the feed section selected by the user (multiple selection allowed). The user selects a plurality of feed sections from among:
 10 "Paper feed tray" " " "Upper cassette" "Lower cassette" and "Paper Deck". The "Paper deck" is only valid when installed as an option.

[Tray Priority (E)] : The user selects whether or not to assign a priority to the paper feed tray in auto feed.
 15 This [Tray Priority (E)] is only operable when "Paper Tray" was selected by the user in [Auto Feed (K)]. The user selects a priority (or not) for the paper feed tray during auto paper feed with ON or OFF.

[Tray Paper Size (S)] : The user selects a paper
 20 size for the tray with this item. This function is only valid when "Paper Tray" has been selected by the user in [Paper Feed (I)], or when "Auto" was selected in [Paper Feed (I)], or when the user selects "Paper Feed Tray" with [Auto Feed (K)]. The user selects the tray size from among "A5" "B5"

"A4" "B4" "A3" "Letter(R)" "Legal" "Executive" "Free" and
 "User paper" "YOGATA 4GO" "KAKUGATA 2GO".

[Envelope Size (F)] : The user selects the envelope
 feeder size with this item. This is only valid when the
 5 envelope feeder option has been installed and the "Paper
 Feeder" selected with [Paper Feed (I)]. The user selects the
 envelope size from among "YOGATA 4GO" "Free" and "User
 Paper".

[Eject paper (O)] button : The user selects the
 10 paper eject section with this item. The user selects eject
 from the "Eject paper tray" or "Sub eject tray".

[OK] button : The user selects this button to
 validate the settings for the Printer Paper Feed/Eject Sheet
 (Fig. 58) and close the dialog box. The printer settings are
 15 updated (changed) when the user has made changes to the
 settings.

[Cancel] button : The user selects this button to
 invalidate the settings that were made in the Printer Paper
 Feed/Eject Sheet (Fig. 58) and close the dialog box.

20 [Update (A)] button : The user selects this button
 to update the printer settings that were made in the Printer
 Paper Feed/Eject Sheet (Fig. 58).

[Help (H)] button : The user selects this button
 to display the online help.

Operation with the [Update(A)] button is only valid when the user has made changes to the settings.

[Help] button : Displays online help.

[Shared Print Environment Basic Set Sheet (See Fig. 59)]

When the user clicks the [Share] tab on the upper side of the Printer Environment Set Dialog Box , the Shared Print Environment Basic Set Sheet o Fig. 59 appears. This Shared Print Environment Basic Set Sheet is making basic settings to the shared print environment for the device selected by the user.

Detailed Specifications

[Copy sheet count (P)] : Sets the number of copy sheets in a range from 1 - 255.

[Super smooth (Z)] : The user selects whether or not to use the Super smooth function. The user selects with ON or OFF whether or not to use Super smooth.

[Toner economy mode (X)] : The user selects whether or not to use the toner economy mode. The user selects with ON or OFF whether or not to use toner economy mode.

[Toner contrast (N)] : The user selects the toner contrast in increments of 1 - 8.

[Data resolution] : The user selects data resolution (Fine (600DPI) (Quick 300DPI). The user selects the data resolution from among "Fine(G)" and "Quick(Q)".

[Doublesided Mode] : The user selects here whether
5 or not to perform doublesided printing. The user selects doublesided mode from among "one-sided print (S)" and "doublesided print (D)". Doublesided printing (D) is only available when the doublesided unit option is installed.

[Binding width (B)] : The user enters a bind width
10 (border for binding allowance) from -30.0 - 30.0mm in 0.5 segments.

[Binding direction] : The user selects the binding direction here (direction of binding paper edge). The user selects the direction from among "Longitudinal (L)" and
15 "Width-wise (W)".

[Expand (E)] button : The user selects the [Expand (E)] button to make expanded settings to the shared print environment on the opened Shared Print Environment Expansion Dialog Box (Fig. 63).

20 [Print adjust (C)] button : The user selects the [Print adjust (C)] button to open the Print Adjust Dialog Box (Fig. 67) and make print adjustment related settings.

the user enters is only valid in when [Time until sleep (P)] is set with ON also selected. The user selects the time to shift to sleep mode from among "15 minutes" 30 minutes" or "60 minutes".

5 [Auto error skip (X)] : The user selects here whether to implement Auto error skip mode. The user selects ON or OFF as needed to implement (or not) the Auto error skip mode.

10 [Warning display (D)] : The user selects here whether to display a message when the user issues a warning (alarm). The user selects ON or OFF as needed to issue (or not issue) the display.

15 [Warning response] : The user selects here whether to continue or to stop printing when a warning (alarm) is issued. The user selects from among "Continue (K)" or "Stop (N)".

 [Buzzer warning] : The user selects how buzzer warning will sound when an error (alarm) occurs. The user selects from "Once (F)" and "Continuous (O)".

20 [Language Display] : The user selects the language shown on the panel message. The user selects the message language from among "Japanese(J)" or "English(E)".

 [Vertical offset (U)] : The user inputs here the amount of movement longitudinally in the print position. The

user enters the movement amount in 0.5 segments from -50.0 to 50.0mm.

[Horizontal offset (Y)] : The user inputs here the amount of movement horizontally in the print position. The user enters the movement amount in 0.5 segments from -50.0 to 50.0mm.

[OK] button : The user selects this button to validate the settings that were entered in the Shared Print Environment Expansion Dialog Box (Fig. 63) and to close the dialog box. The printer settings are updated at this time.

[Cancel] button : The user selects this button to invalidate the settings that were made in the Shared Print Expansion Environment Dialog Box (Fig. 63) and close the dialog box.

[Update (A)] button : The user selects this button to update the printer settings made in the in the Shared Print Environment Expansion Dialog Box (Fig. 63). This [Update (A)] button can only be used when changes in the settings have been made by the user.

[Help (H)] button : The user selects this button to display the online help.

In [Job time-out (T)] when the user enters a value other than 5 to 300 seconds, the message in Fig. 64 appears. and the display returns to the Printer Environmental Set

Dialog Box. In [Vertical offset (U)] or [Horizontal offset (Y)] when the user enters a value between -50.0 and 50.0mm, the message in Fig. 65 appears and the display returns to the Shared Print Environment Expansion Dialog Box (Fig. 63).

- 5 In [Vertical offset (U)] or [Horizontal offset (Y)] when the user enters a value not in 0.5 increments between -50.0 and 50.0mm, the message in Fig. 66 appears and the display returns to the Printer Environmental Expansion Dialog Box (Fig. 63).

[Print Adjust Dialog Box (See Fig. 67)]

- 10 When the user selects the [Print Adjust] button on the Shared Print Environment Basic Set Sheet (Fig. 54), the Print Adjust Dialog Box shown in Fig. 67 appears. This Print Adjust Dialog Box (Fig. 67) is for the user to make settings relating to print adjustments for devices selected
15 by the user.

Detailed Specifications

- [MaxiMem(M)] : This allows the user to select whether or not to use band decompression during subclose for Fine mode (600DPI). The user selects ON or OFF as needed to
20 use (or not) band decompression during subclose for Fine mode (600DPI).

[Band control (B)] : The user selects whether or not to use band processing as the data processing method.

[Halftone adjust] : The user selects this pattern during conversion from a multi to a binary value. The user selects the pattern, from "Pattern1 (R)" "Pattern2 (G)" during conversion to the binary pattern.

5 [OK] button : The user selects this button to validate settings made in the Print Adjust Dialog Box (Fig. 67) and then close the dialog box. The printer settings are updated at this point, when the user has made changes to the settings.

10 [Cancel] button : The user selects this button to invalidate the settings that were made in the Print Adjust Set Dialog Box (Fig. 67) and close the dialog box.

[Update (A)] button : The user selects this button to update the printer settings made in the in the Print Adjust Set Dialog Box (Fig. 67). This [Update (A)] button can only be used when changes in the settings have been made by the user.

[Help (H)] button : The user selects this button to display the online help.

20 [Print Operation Mode Dialog Box (Fig. 68)]

When the user selects the [Operation mode] button from shared print environment set sheet (Fig. 59), the Print Operation Mode Dialog Box of Fig. 68 appears. This Print

Operation Mode Dialog Box is for the user to set the print operating mode for the device selected by the user.

Detailed Specifications

[Operating mode (M)] : This user selects the
5 operating mode with this item. The user selects the operating mode from among; "LIPS" "N201" "ESC/P" "HEX-DUMP" and "LIPS-DUMP".

[Auto emulation (S)] : The user selects an emulator subject to auto emulation (a plurality can be selected). This
10 [Auto emulation (S)] can only be selected when "Auto" has been selected in [Operating Mode (M)]. The user selects a plurality of emulators subject to auto emulation from among "LIPS" "N201" and "ESC/P".

[Priority operation emulation (E)] : The user
15 assigns emulation priority with this item during auto emulation. This [Priority operation emulation (E)] is only valid when "Auto" has been selected in [Operating Mode (M)]. The user selects the auto emulation for priority from among "LIPS" "N201" and "ESC/P".

[OK] button : The user selects this button to
20 validate settings made in the Print Operation Mode Dialog Box (Fig. 68) and then close the dialog box. The printer settings are updated at this point, when the user has made changes to the settings.

[Multiple page printing (N)] : The user selects multiple page printing for LIPS with this item. The user selects from among "Do Not Use" "2-Page left" "2-Page right" "4-Page side left" "4-Page side right" "4-Page vertical left" and "4-Page vertical right" for multiple page printing mode
5 with LIPS.

[Print direction] : The user selects this item to set the LIPS printing direction.

The user sets the LPS printing direction from among
10 "Portrait (P)" and "Landscape (L)".

[Chinese character code (K)] : The user selects the Chinese character code for LIPS with this item. The user selects from among "JIS" "SJIS" "EUC" and "DEC" for the Chinese character code.

15 [Character size (S)] : The user selects the LIPS character size with this item. The user selects from among "8 Point" "10 Point" and "12 Point" for the LIPS character size.

[Chinese character style (J)] : The user selects
20 the LIPS character style with this item, from among "Gothic" and others.

[ANK style (I)] : The user selects the ANKS style for LIPS with this item, from among "Gothic" "Line Printer" and others.

[Expand (E)] button : This button opens the LIPS print environment expansion dialog box shown in Fig. 70 for making environment expansion settings of the LIPS print environment.

5 [Utility (U)] button : This button opens the LIPS utility dialog box shown in Fig. 74 for implementing the LIPS utility.

[OK] button : The user selects this button to validate settings made in the LIPS Print Environment Basic Set Sheet (Fig. 69) and then close the dialog box. The printer settings are updated at this point, when the user has made changes to the settings.

[Cancel] button : The user selects this button to invalidate the settings that were made in the LIPS Print Environment Basic Set Sheet (Fig. 69) and close the dialog box.

[Update (A)] button : The user selects this button to update the printer settings made in the LIPS Print Environment Basic Set Sheet (Fig. 69). This [Update (A)] button can only be used when changes in the settings have been made by the user.

[Help (H)] button : The user selects this button to display the online help.

[LIPS Print Environment Expansion Set Dialog Box
(See Fig. 70)]

Pressing the [Expand] button on the LIPS Print
Environment Basic Set Sheet (Fig. 69) shows the LIPS Print
5 Environment Expansion Set Dialog Box on Fig. 70. This LIPS
Print Environment Expansion Set Dialog Box (Fig. 70) is for
setting the details of the LIPS print environment on the
device selected by the user.

Detailed Specifications

10 [Number of lines] : The user selects the page line
set mode for one page of LIPS with this item. The user selects
the LIPS page line set mode for one page from among "6LPI
(B)" "8LPI (G)" and "Set number of lines (L)".

[Set number of lines (L)] : The user enters the
15 number of lines for one page of LIPS with this item. This
[Set number of lines (L)] is only valid when "Set number of
lines" has been selected with [No. of lines] by the user.
The user enters from 10 - 99 lines here in one line increments.

[Number of columns] : The user selects the number
20 of columns mode for one page of LIPS with this item. This
number of columns mode is selected for one page from among
"Auto(V)" "10CPI(I)" "12CPI(M)" "15CPI(F)" "Number of
columns set (C)".

[Set number of columns (C)] : The user enters the number of columns for one page of LIPS with this item. This function is only valid when [Set number of columns (C)] in [Number of columns] is used. The user sets the number of
5 columns from 10 - 200 columns.

[Auto new page (P)] : The user sets here whether to use automatic new page function in LIPS. Uses sets ON or OFF to select use (or not) of automatic new page function in LIPS.

10 [Auto new line (D)] : The user sets here whether to use automatic new line function in LIPS. Uses sets ON or OFF to select use (or not) of automatic new line function in LIPS.

[LF function] : The user sets here whether to use the LF function in LIPS. The user selects the LF function for LIPS from among "LF(U) and "LF+CR(R)".
15

[CR function] : The user sets here whether or not to use the CR function in LIPS. The user selects the CR function for LIPS from among "CR(J) and "CR+LF(E)".

20 [Auto paper save (W)] : The user sets here whether to use automatic paper save function in LIPS. Uses sets ON or OFF to select use (or not) of automatic paper save function in LIPS.

[OK] button : The user selects this button to validate settings made in the LIPS Print Expansion Environment Set Sheet (Fig. 70) and then close the dialog box. The printer settings are updated at this point, when the user has made changes to the settings.

15 [Cancel] button : The user selects this button to
invalidate the settings that were made in the LIPS Print
Expansion Environment Set Sheet (Fig. 70) and close the
dialog box.

[Update (A)] button : The user selects this button to update the printer settings made in the LIPS Print Expansion Environment Set Sheet (Fig. 70). This [Update (A)] button can only be used when changes in the settings have been made by the user.

[Help (H)] button : The user selects this button to display the online help.

Other operations :

In [Set number of lines (L)] when the user enters a value other than 10 to 99, the message in Fig. 71 appears. and the display returns to the LIPS Print Expansion

- 5 Environment Dialog Box. In [Set number of columns (C)] when the user enters a value between 10 and 200 columns, the message in Fig. 72 appears and the display returns to the LIPS Print Expansion Environment Dialog Box. In [Start-up macro (S)] or [Overlay1 (K)] or [Overlay2 (Q)] when the user enters a
- 10 value not between 0 and 32767, the message in Fig. 73 appears and the display returns to the LIPS Print Expansion Environment Dialog Box.

[LIPS Utility Dialog Box (See Fig. 74)]

- When the user selects the [Utility] button on the
- 15 LIPS Print Environment Basic Sheet (Fig. 69), the LIPS Utility Dialog Box of Fig. 74 appears. This LIPS Utility Dialog Box is for implementing the LIPS utility for the device that the user selected.

Detailed Specifications

- 20 [Status print (S)] : Implements the LIPS status print when selected by the user. The LIPS status print is implemented after being set online.

[Overlay print (O)] : Implements the LIPS overlay print when selected by the user. The LIPS overlay print is implemented after being set online.

[Overlay list (V)] : Prints out the LIPS overlay
5 list when selected by the user. The LIPS overlay list is printed after being set online.

[Font list (F)] : Outputs the LIPS font list when selected by the user. The LIPS font list is output after being set online.

10 [Macro list (M)] : Outputs the LIPS macro list when selected by the user. The LIPS macro list is output after being set online.

[OK] button : The user selects this button to close the dialog box.

15 [Help (H)] button : The user selects this button to display the online help.

Other operations :

When the user selects the [Status print (S)] or [Overlay print (O)] or [Overlay list (V)] or [Font list (F)]
20 or [Macro list (M)] buttons with the printer set online, the message in Fig. 75 appears. When the user selects the [OK] button and implements the target utility, the display returns to the LIPS Utility Dialog Box (Fig. 74) . When the user selects

the [Cancel] button, the display returns to the LIPS Utility Dialog Box (Fig. 74) with no other operations performed.

[N201 Print Environment Basic Set Sheet (Fig. 76)]

When the user clicks the tab indicating [N201] on
5 the upper part of the Printer Environment Set Dialog Box,
the N201 Print Environment Basic Set Sheet appears as shown
in Fig. 76. This N201 Print Environment Basic Set Sheet (Fig.
76) is for setting the N201 basic print environment for the
device the user has selected.

10 Detailed Specifications

[Page format (P)] : The user selects the N201 page
format with this item. The user selects from "Actual size
(Vertical)" "Actual size (Horizontal)" "10"→A4Vert,
"15"→A4Horiz, "15"→B4Horiz., "2/3Vert", "2/3Horiz." for

15 the N201 page format.

[Paper position] : The user selects the N201 paper
position here. The user selects from "Center(Y)" and
"Left(L)" as the N201 paper position.

[Upper border (W)] : The user inputs the N201 upper
20 border here. The user inputs from -127 to 127 as the N201
upper border.

[Paper position fine adjust (B)] : The user inputs
the N201 paper position (left-right fine adjust value) here.
The user inputs from -127 to 127 as the N201 paper position.

5 [Paper size (D)] : The user selects the N201 paper size. The user selects the N201 paper size from among "Current paper size" "A3" "B4" "A4" "B5" and "A5".

[2-page print set (N)] : The user selects whether or not to 2-page printing on the N201 with this item. The user sets "Do not use" "Left" or "Right" for 2-page printing on the N201.

[Chinese character style (J)] : The user selects the Chinese character style for the N201 with this item. The user selects from among "Mincho" "Gothic" "Round Gothic" and "ID2" for the N201 Chinese character style.

[Font ID (E)] : This item is only valid when "ID" was selected in [Chinese character style (J)]. The user enters the font ID for the Chinese character style option on the N201 as a value between 1 and 999.

20 [Chinese character size (S)] : The user selects
the Chinese character size for the N201 with this item. The
user selects the Chinese character size on the N201 from among
"System" "8 Point" "10 Point" and "12 Point".

[External character size]: The user selects the External character size for use on the N201 with this item. The user selects the External character size on the N201 from among "10.8 Point (G)" and "10 Point (M)".

5 [Graphic] : The user selects the N201 graphic dot pitch with this item. The user selects the graphic dot pitch for the N201 from among "Native (Q)" and "Copy (R)".

[Expansion1 (K)] button : The user uses this button to open the N201 Print Environment Expansion1 Dialog Box (Fig. 10 79) for making expansion setting(1) of the N201 print environment.

[Expansion2 (X)] button : The user uses this button to open the N201 Print Environment Expansion2 Dialog Box (Fig. 82) for making expansion setting(2) of the N201 print 15 environment.

[Utility (U)] button : The user uses this button to open the N201 Utility Dialog Box (Fig. 86) for implementing the N201 utility.

[OK] button : The user selects this button to 20 validate settings made in the N201 Print Environment Basic Set Sheet (Fig. 76) and then close the dialog box. The printer settings are updated at this point, when the user has made changes to the settings.

[Cancel] button : The user selects this button to invalidate the settings that were made in the N201 Print Environment Basic Set Sheet (Fig. 76)) and close the dialog box.

5 [Update (A)] button : The user selects this button to update the printer settings made in the N201 Print Environment Basic Set Sheet (Fig. 76). This [Update (A)] button can only be used when changes in the settings have been made by the user.

10 [Help (H)] button : The user selects this button to display the online help.

Other operations :

When the user inputs a value other than -127 to 127 in [Upper border(W)] or in [Paper position fine adjust (B)], then the message in Fig. 77 appears and the display returns to the Printer Environment Set Dialog Box. When the user inputs a value other than 1 through 999 in [Font ID (E)], the message in Fig. 78 appears and the display returns to the Printer Environment Set Dialog Box.

20 [N201 Print Environment Expansion1 Dialog Box (Fig. 79)]

When the user clicks the [Expand1] button on the N201 Print Environment Basic Set Sheet (Fig. 76), the N201 Print Environment Expansion1 Dialog Box (Fig. 79) appears.

This N201 Print Environment Expansion1 Dialog Box (Fig. 79) is for making detailed N201 basic print environment settings for the device the user has selected.

Detailed Specifications

5 [Zone] : The user selects the N201 print zone mode with this item. The user selects the N201 print zone mode from among "Standard (Q)" and "Wide (W)".

 [Right margin] : The user selects the right margin position for the N201 with this item. The user selects the
10 N201 right margin position from among "136col.(Y)" and "Right edge (R)".

 [Single form length (S)] : The user selects here whether or not to specify the page length of cut paper in N201. The user selects this function (or not) by selecting
15 ON or OFF.

 [Dash line skip (M)] : The user inputs here the number of lines to skip from the bottom edge in N201. The user enters from 0 to 197 lines.

 [Paper length (L)] : The user selects here whether
20 or not to specify page length during reset in N201. The user selects this function (or not) by selecting ON or OFF.

 [Paper length set (D)] : The user enters here the page length of the continuous paper form and the cut paper form in the N201. This can only be selected when [Paper length

set (D)] is set to ON in [Paper length (L)] by the user. The user inputs the page length of the continuous or cut paper in a figure from 1 to 199 lines.

[Register level] : The user selects here the level
5 to store the registration characters in N201. The user selects from "Permanent (P)" and "Temporary (T)" for the level to store the registration characters in N201.

[Zero style] : The user selects [0] style half-size characters on N201. The user selects from "No slash 0 (E)"
10 and "Slash 0 (F)".

[Country letter] : The user selects a character set suitable for matching 1 byte codes matching letters used in different countries. The user selects from among "Japan" "America" "England" "Germany" and "Sweden".

15 [Chinese character graphic set] : The user selects the Chinese character graphic set used by a JIS code in N201. The user selects this JIS code from among "JIS78 (0) and JIS90 (N)".

[CR function] : The user selects the print position
20 movement method during reception of the return code (CR) in N201. The user selects from "Return only (G)" and "Return/New line" (J).

[Print command] : The user selects the print start command forming the control code in the N201. The user selects

the control code from among "CR only (V)" and "CR and so on (K)".

[Buffer file] : The user selects operation when the print position has exceeded the right margin in the N201.

- 5 The user selects the operation from among "Return/New line" (I)" and "Return only (U)" on N201.

- [OK] button : The user selects this button to validate settings made in the N201 Print Environment Expansion1 Dialog Box (Fig. 79) and then close the dialog
10 box. The printer settings are updated at this point, when the user has made changes to the settings.

- [Cancel] button : The user selects this button to invalidate the settings that were made in the N201 Print Environment Expansion1 Dialog Box (Fig. 79) and close the
15 dialog box.

- [Update (A)] button : The user selects this button to update the printer settings made in the N201 Print Environment Expansion1 Dialog Box (Fig. 79). This [Update (A)] button can only be used when changes in the settings
20 have been made by the user.

[Help (H)] button : The user selects this button to display the online help.

Other operations :

[Fixed columns (C)] : The user selects whether or not to use the fixed column function in N201 here. The user selects with ON or OFF whether to use this function.

[Fixed number of columns set (N)] : The user inputs the number of fixed columns for this function in N201. This [Fixed number of columns set (N)] function is only valid when the user has set ON in [Fixed columns (C)]. The user inputs a value from 10 to 400 columns as the fixed column value in N201.

10 [OCR font (F)] : The user selects the OCR font for
use in N201. The user selects from "Do not use" "OCR-B" "OCR-A"
"OCR-B+OCR-kana" "OCR-A+OCR-kana".

```

[New line width (D)] : The user selects the new
line width for N201 here. The user selects from "3LPI" "4LPI"
15  "6LPI" and "8LPI".

```

[Chinese character rate (R)] : The user selects here the Chinese character rate for use in N201. The user selects from among "2/1" "3/2" "4/3" "5/3" and "1/1".

[Start-up macro (M)] : The user enters here the
20 number of the start-up macro to implement on N201. The user
inputs a start-up macro number from 0 to 255.

[System overlay1 (0)] : The user selects here whether or not to implement the system overlay print in N201. The user selects with ON or OFF whether to use this System

overlay1 (0) function. This format data number is only valid when ON has been selected in [System overlay1 (0)]. The user enters the format data number for using the system overlay print selected by the user. The user inputs a value from 1 to 5 as the format data number for using the system overlay print function.

[The user overlay1 (U)] : The user selects here whether or not to implement the user overlay `print1` in N201. The user selects whether or not to implement in N201 by selecting ON or OFF.

[The user overlay2 (V)] : The user selects here whether or not to implement the user overlay print2 in N201. The user selects whether or not to implement in N201 by selecting ON or OFF.

15 [Ignore new line after HEX (I)] : The user selects
here whether or not to set ignoring of new line after HEX
mode in N201. The user selects this function (or not) by
selecting ON or OFF.

[HEX/LIPS (X)] : The user selects here whether or
20 not to use the HEX/LIPS function in N201. The user selects
this function (or not) by selecting ON or OFF.

[LIPS form] : The user selects the LIPS form for N201 with this item. The user selects from among "LIPS2(P)" and "LIPS4(P)" as the LIPS form in N201.

[OK] button : The user selects this button to validate settings made in the N201 Print Environment Expansion2 Dialog Box (Fig. 82) and then close the dialog box. The printer settings are updated at this point, when
5 the user has made changes to the settings.

[Cancel] button : The user selects this button to invalidate the settings that were made in the N201 Print Environment Expansion2 Dialog Box (Fig. 82) and close the dialog box.

10 [Update (A)] button : The user selects this button to update the printer settings made in the N201 Print Environment Expansion2 Dialog Box (Fig. 82). This [Update (A)] button can only be used when changes in the settings have been made by the user.

15 [Help (H)] button : The user selects this button to display the online help.

Other operations :

When the user enters a value other than 10 to 400 for [Fixed number of lines] or [Fixed columns], the message
20 in Fig. 83 appears and the display returns to the N201 Print Environment Expansion2 Dialog Box (Fig. 82). When the user enters a value other than 0 to 255 in the [Start-up macro (M)] the message in Fig. 84 appears and the display returns to the N201 Print Environment Expansion2 Dialog Box (Fig.

82). When the user enters a value other than 1 to 5 in [System overlay (O)], the message in Fig. 85 appears and the display returns to the N201 Print Environment Expansion2 Dialog Box (Fig. 82).

5 [N201 Utility Dialog Box (See Fig. 86)]

The N201 Utility Dialog Box shown in Fig. 86 appears when the user clicks the [Utility] button of the N201 Print Environment Basic Set Sheet (Fig. 76). This N201 Utility Dialog Box (Fig. 86) is for implementing the N201
10 utility for the device selected by the user.

Detailed Specifications

[Status print (S)] button: The user selects this item to implement the status print for N201. Status print is implemented after setting the N201 online.

15 [Overlay print (O)] button: The user selects this item to implement the overlay print for N201. Overlay print is implemented after setting the N201 online.

[OK] button : The user selects this button to close the dialog box.

20 [Help (H)] button : The user selects this button to display the online help.

Other operations :

When the user selects the [Status print (S)] or [Overlay print (O)] buttons with the printer set online, the

message in Fig. 87 appears. When the user selects the [OK] button and implements the target utility, the display returns to the N201 Utility Dialog Box (Fig. 86). When the user selects the [Cancel] button, the display returns to the N201 Utility
 5 Dialog Box (Fig. 86) with no other operations performed.

[ESC/P Print Environment Basic Set Sheet (See Fig. 88)]

When the user clicks the [ESC/P] on the upper part of the Printer Environment Set Dialog Box, the ESC/P Print
 10 Environment Basic Set Sheet of Fig. 88 appears. The ESC/P Print Environment Basic Set Sheet (Fig. 88) is for setting the basic ESC/P print environment for the device selected by the user.

Detailed Specifications

15 [Page format (P)] : The user selects the ESC/P page format with this item. The user selects from "Actual size (Vertical)" "Actual size (Horizontal)" "10"→A4Vert", "15"→A4Horiz", "15"→B4Horiz.", "B4"→A4Vert." and "B4"→A4Horiz." for the ESC/P page format.

20 [Upper border (W)] : The user inputs the ESC/P upper border here. The user inputs from -127 to 127 as the upper border.

The user enters the font ID for the Chinese character style option on the ESC/P as a value between 1 and 999.

[Chinese character size (S)] : The user selects the Chinese character size for the ESC/P with this item. The user selects the Chinese character size on the ESC/P from among "System" "8 Point" "10 Point" and "12 Point".

[Expansion1 (K)] button : The user uses this button to open the ESC/P Print Environment Expansion1 Dialog Box (Fig. 91) for making expansion setting(1) of the ESC/P print environment.

[Expansion2 (X)] button : The user uses this button to open the ESC/P Print Environment Expansion2 Dialog Box (Fig. 94) for making expansion2 setting of the ESC/P print environment.

[Utility (U)] button : The user uses this button to open the ESC/P Utility Dialog Box (Fig. 98) for implementing the ESC/P utility.

[OK] button : The user selects this button to validate settings made in the ESC/P Print Environment Basic Set Sheet (Fig. 88) and then close the dialog box. The printer settings are updated at this point, when the user has made changes to the settings.

[Cancel] button : The user selects this button to invalidate the settings that were made in the ESC/P Print

Environment Basic Set Sheet (Fig. 88) and close the dialog box.

[Update (A)] button : The user selects this button to update the printer settings made in the ESC/P Print Environment Basic Set Sheet (Fig. 88). This [Update (A)] button can only be used when changes in the settings have been made by the user.

[Help (H)] button : The user selects this button to display the online help.

10 Other operations :

When the user inputs a value other than -127 to 127 in [Upper border (W)] or in [Paper position fine adjust (B)], then the message in Fig. 89 appears and the display returns to the Printer Environment Set Dialog Box. When the user inputs a value other than 1 through 999 in [Font ID (E)], the message in Fig. 90 appears and the display returns to the Printer Environment Set Dialog Box.

[ESC/P Print Environment Expansion1 Dialog Box (Fig. 91)]

20 When the user clicks the [Expand1] button on the ESC/P Print Environment Basic Set Sheet (Fig. 88), the ESC/P Print Environment Expansion1 Dialog Box (Fig. 91) appears. This ESC/P Print Environment Expansion1 Dialog Box (Fig. 91)

[Dash line skip (M)] : The user inputs here whether to specify the number of lines to skip from the bottom edge in ESC/P. This function is only valid when the user selects ON in [Dash line skip (M)]. The user enters from 1 to 31 lines
5 as the number of lines to skip from the bottom edge in ESC/P.

[Character code table] : The user selects a character set for setting in a 1 byte code table for ESC/P. The user selects the character set from "Katakana (J)" and "Graphics (O)" for entry in the code table for ESC/P.

10 [Country letter (C)] : The user selects a suitable character set corresponding to the country for the one byte code in ESC/P. The user makes a selection from among "Japan" "Norway" "Denmark2" "Spain2" "Latin America" "America" "France" "Germany" "England" "Denmark" "Sweden" "Italy" and
15 "Spain".

[Register level] : The user selects here the level to store the registered characters for ESC/P. The user selects from "Permanent (P)" and "Temporary (T)" as the level to store the registration characters for ESC/P.

20 [New line] : The user selects how to move the print position when the return code (CR) was received for ESC/P. The user selects from among "Standby for LF command(F)" and "New line (E)".

[OK] button : The user selects this button to validate settings made in the ESC/P Print Environment Expansion1 Dialog Box (Fig. 91) and then close the dialog box. The printer settings are updated at this point, when
5 the user has made changes to the settings.

[Cancel] button : The user selects this button to invalidate the settings that were made in the ESC/P Print Environment Expansion1 Dialog Box (Fig. 91) and close the dialog box.

10 [Update (A)] button : The user selects this button to update the printer settings made in the ESC/P Print Environment Expansion1 Dialog Box (Fig. 91). This [Update (A)] button can only be used when changes in the settings have been made by the user.

15 [Help (H)] button : The user selects this button to display the online help.

Other operations :

When the user inputs a value other than 1 to 199 in [Continuous paper length (L)] or [Single paper length
20 (S)], the message in Fig. 92 appears and the display returns to the ESC/P Print Expansion 1 Set Dialog Box (Fig. 91). When the user inputs a value other than 1 to 31 in [Dash line skip (M)], the message in Fig. 93 appears and the display returns to the ESC/P Print Expansion 1 Set Dialog Box (Fig. 91).

[ESC/P Print Environment Expansion2 Dialog Box
(Fig. 94)]

When the user clicks the [Expand2] button on the
ESC/P Print Environment Basic Set Sheet (Fig. 88), the ESC/P
5 Print Environment Expansion2 Dialog Box (Fig. 94) appears.
This ESC/P Print Environment Expansion2 Dialog Box (Fig. 94)
is for making detailed ESC/P basic print environment settings
for the device the user has selected.

Detailed Specifications

10 [Fix line (L)] : The user selects whether or not
to use the fix line function for ESC/P. The user selects with
ON or OFF whether to use this function.

[Fixed number of lines (E)] : The user here inputs
the fixed number of lines for the Fix Line function in ESC/P.
15 This function is only valid when the user has set ON in [Fix
line (L)]. The user inputs a value from 10 to 400 lines in
1 increment as the fixed number of lines for use in this
function.

[Fixed columns (C)] : The user selects whether or
20 not to use the fixed column function in ESC/P here. The user
selects with ON or OFF whether to use this function.

[Fixed number of columns set (N)] : The user inputs
the number of fixed columns for this function in ESC/P. This
[Fixed number of columns set (N)] function is only valid when

the user has set ON in [Fixed columns (C)]. The user inputs a value from 10 to 400 columns in 1 increment as the fixed column value in ESC/P.

[Chinese character rate (R)] : The user selects here the Chinese character rate for use in ESC/P. The user selects from among "2/1" "3/2" "4/3" "5/3" and "1/1".

[Start-up macro (M)] : The user enters here the number of the start-up macro to implement on ESC/P. The user inputs a start-up macro number from 0 to 255.

10 [System overlay1 (O)] : The user selects here whether or not to implement the system overlay print in ESC/P. The user selects with ON or OFF whether to implement this system overlay print. This format data number is only valid when ON has been selected in [System overlay1 (O)]. The user enters this number for using the system overlay print when selected by the user. The user inputs a value from 1 to 5 in 1 increment as the format data number for using the system overlay print function.

20 [User overlay1 (U)] : The user selects here whether or not to implement the user overlay print1 in ESC/P. The user selects whether or not to implement in ESC/P by selecting ON or OFF.

[User overlay2 (V)] : The user selects here whether or not to implement the user overlay print2 in ESC/P. The

user selects whether or not to implement in ESC/P by selecting ON or OFF.

[Ignore new line after HEX (I)] : The user selects here whether or not to set ignoring of new line after HEX mode in ESC/P. The user selects this function (or not) by selecting ON or OFF.

[HEX/LIPS (X)] : The user selects here whether or not to use the HEX/LIPS function in ESC/P. The user selects this function (or not) by selecting ON or OFF.

10 [LIPS form] : The user selects the LIPS form for ESC/P with this item. The user selects from among "LIPS2(P)" and "LIPS4(P)" as the LIPS form in ESC/P.

[OK] button : The user selects this button to validate settings made in the ESC/P Print Environment Expansion2 Dialog Box (Fig. 94) and then close the dialog box. The printer settings are updated at this point, when the user has made changes to the settings.

[Cancel] button : The user selects this button to invalidate the settings that were made in the ESC/P Print Environment Expansion2 Dialog Box (Fig. 94) and close the dialog box.

[Update (A)] button : The user selects this button to update the printer settings made in the ESC/P Print Environment Expansion2 Dialog Box (Fig. 94). This [Update

(A)] button can only be used when changes in the settings have been made by the user.

[Help (H)] button : The user selects this button to display the online help.

- 5 When the user enters a value other than 10 to 400 for [Fixed number of lines] or [Fixed columns], the message in Fig. 95 appears and the display returns to the ESC/P Print Environment Expansion2 Dialog Box (Fig. 94). When the user enters a value other than 0 to 255 in the [Start-up macro
- 10 (M)] the message in Fig. 96 appears and the display returns to the ESC/P Print Environment Expansion2 Dialog Box (Fig. 94). When the user enters a value other than 1 to 5 in [System overlay (O)], the message in Fig. 97 appears and the display returns to the ESC/P Print Environment Expansion2 Dialog Box
- 15 (Fig. 94).

[ESC/P Utility Dialog Box (See Fig. 98)

- The ESC/P Utility Dialog Box shown in Fig. 88 appears when the user clicks the [Utility] button of the ESC/P Print Environment Basic Set Sheet (Fig. 98). This ESC/P
- 20 Utility Dialog Box (Fig. 98) is for implementing the ESC/P utility for the device selected by the user.

Detailed Specifications

[Status print (S)] button: The user selects this item to implement the status print for ESC/P. Status print is implemented after setting the ESC/P online.

5 [Overlay print (P)] button: The user selects this item to implement the overlay print for ESC/P. Overlay print is implemented after setting the ESC/P online.

[OK] button : The user selects this button to close the dialog box.

10 [Help (H)] button : The user selects this button to display the online help.

Other operations :

When the user selects the [Status print (S)] or [Overlay print (O)] buttons with the printer set online, the message in Fig. 99 appears. When the user selects the [OK]
15 button and implements the target utility, the display returns to the ESC/P Utility Dialog Box (Fig. 98). When the user selects the [Cancel] button, the display returns to the ESC/P Utility Dialog Box (Fig. 98) without performing other operations.

20 [Jobs sheet (See Fig. 100)]

NetSpot shows the Job sheet in Fig. 100 when the user clicks the [Job] tab on the left side of the device window (Fig.43). This Jobs sheet is for showing the current Job status for the device selected by the user.

All functions for this Jobs sheet (Fig. 100) are implemented by utilizing NetWare services so the Jobs sheet is only valid when the NetWare service is available. The functions shown next in Table 12 are provided by the Jobs
5 sheet (Fig. 100) in the controller mode and general user mode.

For some of these functions, the NetWare file server must be logged into as the Administrator in order to make use of the function, regardless of the mode being operated.

2025-06-20 14:00:00

Table 12
List of functions supported by Jobs sheet

ITEM NO.	FUNCTION	Admin	User
1	Monitoring of all jobs <ul style="list-style-type: none"> • Document name • Owner • Status (while printing/in standby/spooling) • Progress status (document size or 0 byte units) • Start time (Time job is registered with print queue) 	<input type="radio"/>	<input type="radio"/>
2	Job control implemented by logged-in user for own job <ul style="list-style-type: none"> • Delete job in standby • Pause/restart job in standby 	<input type="radio"/>	<input type="radio"/>
3	Implement control of all jobs (only when logged in to NetWare file server as administrator) <ul style="list-style-type: none"> • Delete job in standby • Pause/restart jog in standby • Interchange job priority order during standby 	<input type="radio"/>	<input type="radio"/>
4	Change printer queue settings <ul style="list-style-type: none"> • Select NetWare file server • Log in to NetWare file server • Display list of all printer queues • Display list of registered printer queues • Add to printer queue registration • Delete from printer queue registration 	<input type="radio"/>	<input type="radio"/>

In "Monitoring of all jobs" each job queue relating to the logged-in NetWare file server: Document name, Status (while printing/in standby/spooling), Owner, Progress status (document size or 0) byte units)), Start time (Time
 5 that job is registered with print queue) are displayed for the job matching the device the user has selected.

In terms of control for implementing jobs, those possessed by the user himself can be deleted in standby, or can be paused/restarted in standby. Further, when logged in
 10 as an administrator to the NetWare file administrator; deletion of jobs in standby, pause/restart of jobs in standby and interchanging of job priority of jobs in standby is possible.

Detailed Specifications

15 [Queue (Q)] : The user selects the printer queue for displaying the list of jobs with this item. When this item is selected, the printer queues shown in [Registered printer queues (R)] in the Printer Queue Change Dialog Box (Fig. 101) become selection candidates. When the selected
 20 printer queue is not logged-in to the associated NetWare file server, a NetWare dialog box(Fig. 34) opens to allow log-in to the NetWare file server.

[Change (C)] : Clicking this button opens the Printer Queue Change Dialog Box (Fig. 101) for changing the printer queue settings.

[Job list display] : Displays the list of document
5 names, owners, status, progress status, start dates for each job selected with [Queue (Q)]. The user selects the job from the list.

[Restart (R)] button : Restarts previously stopped jobs selected with the [Job list display]. This function is
10 only valid when the stopped job of the user himself was selected.

[Stop (P)] button : Stops jobs selected with the [Job list display]. This function is only valid when a non-stopped job of the user himself was selected.

[Delete (E)] button : Deletes the job selected with
15 the [Job list]. This button is only valid for jobs selected by the user himself.

[TO FRONT (V)] button : Moves the job selected with [Job list] forwards. This button is only valid when
20 logged in as administrator to the NetWare file server and only for the selected job.

[TO REAR (N)] button : Moves the job selected with [Job list] to the rear. This button is only valid when logged

server (S)]. Printer queues registered in the bindery of the NetWare file server selected with [NetWare server (S)] become candidates for selection.

[Add (A)] button : Adds a printer queue

- 5 registration. Adds a printer queue selected with [Printer queue (Q)] to the [Registered printer queue (R)]. This button is only valid when the printer queue was selected with [Printer queue (Q)].

- 10 [Registered printer queue (R)] : Displays a list of registered printer queues. The user selects a registered printer queue. Printer queues registered with the [Add (A)] button are displayed on the list. The user selects from printer queues registered with the [Add (A)] button.

- 15 [Delete (D)] button : Deletes a printer queue registration. Deletes a printer queue selected with [Printer queue (Q)] to the [Registered printer queue (R)]. This button is only valid when the printer queue was selected with [Registered printer queue (R)].

- 20 [OK] button : The user selects this button to validate settings made and then close the dialog box.

[Cancel] button : The user selects this button to invalidate the settings that were made and close the dialog box.

[Installation location] : Displays the installation location in a character string of 0 to 63 character spaces.

[Product version] : Displays the product version
5 of the printer in a character string of 0 to 31 character spaces.

[Toner cartridge model No.] : Display the toner cartridge model No. "EP-W" usable in the printer.

[Environment setting] : Displays the list of
10 environment settings. Shows the status of the
"Emulator" "Total flash ROM capacity" "Available flash ROM capacity"
"Total RAM capacity" "Available RAM capacity"
"Number of cassettes" "Doublesided unit" "Envelope feeder"
"Paper deck" and "Font". The "Font" only displays items with
15 a Font ID.

[Controller info (M) button] : Opens the Controller Information Dialog Box (Fig. 103).

[Help (H)] button : The user selects this button to display the online help.

20 [Controller Information Dialog Box (Fig. 103)]

NetSpot displays the Controller Information Dialog Box shown in Fig. 103 when the user selects the [Controller Info] button of the Information Sheet (Fig. 102). This Controller Information Dialog Box shown in Fig. 103 is

for displaying information on the controller of the device that was selected.

Detailed Specifications

[Name] : Displays the name of the controller in
5 a character string within 0 to 63 spaces.

[Address] : Displays the address of the controller in a character string within 0 to 63 spaces.

[OK] button : The user selects this button to close the dialog box.

10 [Help (H)] button : The user selects this button to display the online help.

[Network Sheet (See Fig. 104)]

NetSpot displays the Network sheet shown in Fig. 104 when the user clicks the tab indicating [Network] on the
15 left side of the device window (Fig. 43). This network sheet is for setting or displaying network information for the selected device. This network sheet (Fig. 104) is only displayed when NetSpot is operating in controller mode. The network sheet provides the functions shown in 14 in
20 controller mode.

Table 14
List of functions supported by the network sheet

ITEM NO.	FUNCTION	Admin	User
1	Network interface board information display · Board name · Version · Physical interface · MAC address · Valid protocol	○	
2	NetWare Information display · Setting information	○	
3	TCP/IP information display · Setting information	○	
4	AppleTalk information display · Setting information	○	
5	SNMP information display · Statistical information	○	

5

Detailed Specifications

[Board name] : Displays the network interface board name.

10 [Version] : Displays the formware version of the network interface board.

[Physical interface] : Displays the physical interface of the network interface board.

[MAC address] : Displays the MAC address of the network interface board.

[Valid protocol] : Displays the valid protocol of the network interface board.

[Protocol info] : The user selects the setting information for display for the protocol. The user selects
5 from among "NetWare (N)" "AppleTalk (A)" "SNMP (M)" or "TCP/IP (I)". NetSpot displays on a list at the right, setting information relating to the protocol or statistical SNMP information selected by the user. A list of items relating to setting information for each protocol is given for the
10 NetWare Set Sheet (Fig. 105), TCP/IP Set Sheet (Fig. 114) or AppleTalk Set Sheet (Fig. 120). A list of the following items is displayed relating to SNMP statistic information. "Total receive SNMP packet count" "Total transmit SNMP packet count" "SNMP packets receive count for unknown community
15 names" "SNMP packet receive count for inapplicable access modes" "Valid Get-Request packet receive count" "Valid Get-Next packet receive count" "Valid Set-Request packet receive count" "Valid generated trap packet count".

[Protocol set (L)] button : Opens the Protocol Set
20 Dialog Box (Fig. 144) for making protocol settings.

[Help (H)] button : The user selects this button to display the online help.

[Protocol Set Dialog Box (See Fig. 144)]

[NetWare Set Sheet (Fig. 105)]

Clicking the [Protocol set] button on the Network Sheet (Fig. 104) or clicking the tab indicating [NetWare] on the upper part of the Protocol Set Dialog Box (Fig. 144),
5 causes NetSpot to display the NetWare Set Sheet in Fig. 105 as the default sheet first shown on the display. This NetWare Set Sheet (Fig. 105) is for setting information relating to NetWare for the device that was selected.

When the NetWare frame type is changed and the
10 network interface board is reset while NetSpot is operating NetWare protocol, accessing the device may prove impossible. In an environment where the NetWare service cannot be used, the user must set "None" in the NetWare print service setting.

Detailed Specifications

15 [Frame type (F)] : The user selects this item to choose the NetWare frame type. The user selects from among : "Invalid" "Auto Detect" "Ethernet II" "Ethernet 802.2" "Ethernet 802.3" and "Ethernet Snap". When the user has set the network interface board to "Auto Detect", NetSpot will
20 continue to display that setting unless the user changes this setting.

[Network No. (N)] : The user enters the 8 digit base 16 network number used in NetWare here.

[Node address] : The user enters the 8 digit base 16 node address used in NetWare here.

[Print service set] : The user selects the print service for use with NetWare here. The user selects from
5 "Print server (S)" "Remote printer (R)" and "None (N)".

[File server name (E)] : The user inputs with the NetWare print server, a character string from 0 to 47 digits for use as the NetWare file server name. This function is only valid when "Print server (S)" was selected with [Print
10 service set]. The NetWare file server names registered in the bindery are available for selection when use of the NetWare service is available.

[Log-in (L)] button : Clicking this button opens the NetWare Log-in Dialog Box (Fig. 34) for logging-in the
15 NetWare file server selected with [File server name (E)]. This function is only possible while NetWare service is available, when "Print server (S)" was selected with [Print service set], or when a still non-logged in NetWare file server was selected in [File server name (E)].

20 [Print server name (P)] : The user inputs a character string from 0 to 47 digits for use as the NetWare print server name. This function is valid on when "None (N)" is selected in [Print service set]. The NetWare print server names registered in the bindery are available for selection

when the Window (OS) is being used, when "Print server (S)" was selected with [Print service set] or when a logged in NetWare file server was selected with [File server name (E)].

[Printer name (U)] : The user inputs a printer name
5 from 0 to 15 characters for use with NetWare. This function is only valid when "None (N)" was selected with [Print service set]. The user must set the same values as set in PCONSOLE of NetWare.

[Form No. (O)] : The user inputs a form number from
10 0 to 255 characters for use with NetWare. This function is only valid when "Print server (S)" was selected with [Print service set]. The user must set the same values as set in PCONSOLE of NetWare.

[Polling interval (I)] : The user inputs the
15 polling interval here in a figure from 1 to 15 seconds on the NetWare print server. This function is only valid when "Print server (S)" was selected with [Print service set].

[Buffer size (B)] : The user inputs the buffer size
20 for use in the NetWare print server in kilobyte units from 1 to 20. This function is only valid when "Print server (S)" was selected with [Print service set]. The user must set the same values as set in PCONSOLE of NetWare. When using NetWare 4.1J, the user must enter a value from 3 to 20.

[Service mode (M)] : The user selects the service mode used with the NetWare print server. This function is only valid when "Print server (S)" was selected with [Print service set]. The selectable service modes are : "Only currently set paper OK" "Paper change OK when needed" "Minimum paper change" and "Minimum paper change within queue". The user must set the same values as set in PCONSOLE of NetWare

[Printer server password (W)] : The user inputs
10 a character string of 0 to 19 characters for use with the
NetWare print server. This function is only valid when "Print
server (S)" was selected with [Print service set]. The user
must set the same values as set in PCONSOLE of NetWare

```

[Standard (D)] button : Returns to the standard
15  setting. Writes all standard values held by NetSpot.

```

[OK] button : The user selects this button to close the dialog box. When changes have been made in the settings, the network interface board settings are updated.

```

[Cancel] button : The user selects this button to
20  invalidate the settings that were made and close the dialog
    box.

```

[Update (A)] button : When changes have been made in the settings, the network interface board settings are

updated. This [Update (A)] button can only be used when changes in the settings have been made.

[Help (H)] button : The user selects this button to display the online help.

5 Other operations :

When the user inputs a value other than 0 to 15 in [Printer No. (U)], the message in Fig. 106 appears and the display returns to the Protocol Set Dialog Box (Fig. 144). When the user inputs a value other than 0 to 255 in [Form
10 No. (O)], the message in Fig. 107 appears and the display returns to the Protocol Set Dialog Box (Fig. 144). When a value other than 1 to 15 is input for [Polling interval (I)] , the message in Fig. 108 appears and the display returns to the Protocol Set Dialog Box (Fig. 144). When the user enters
15 a value other than 1 to 20 for kilobyte unit in [Buffer size (B)] , the message in Fig. 109 appears, and the display returns to the Protocol Set Dialog Box (Fig. 144).

When the user makes a change in any of the settings in the NetWare Set Sheet (Fig. 105) and the user clicks the
20 [OK] button, the message in Fig. 110 appears. When the user clicks the [Yes (Y)] button in the dialog box of Fig. 110, the protocol settings of the network interface board are changed and the Protocol Set Dialog Box (Fig. 144) closes. When the user clicks the [No (N)] button, the Protocol Set

performed after waiting several seconds for a message displaying this status.

When the user changes the settings for [Frame type (F) in the NetWare Set Sheet (Fig. 105) and protocol settings for the network interface board have been completed; in cases where a soft reset of the network interface board was selected and NetSpot is operating the NetWare protocol, the message in Fig. 113 appears just before the soft reset of the network interface board. When the user selects the [Yes (Y)] button in the dialog of Fig. 113, the device window (Fig. 43) closes after performing soft reset of the network interface board. When the user selects the [No (N)] button, the device window (Fig. 43) does not close after performing soft reset of the network interface board.

[TCP/IP Set Sheet (See Fig .114)]

The TCIP Set Sheet shown in Fig. 114 appears when the user clicks the tab indicating [TCP/IP] on the upper side of the Protocol Set Dialog Box (Fig. 144). This TCP/IP Set Sheet (See Fig .114) is for setting information on TCP/IP for the device selected by the user.

When the user. changes TCP/IP frame type and IP address settings while the NetSpot is operating the TCP/IP protocol, and the network interface board is reset, access to the device may prove impossible.

Detailed Specifications

[Frame type (F)] : The user selects the frame type used with TCP/IP. The user selects the frame type from among "Invalid" and "ETHERNET II".

- 5 [IP address set method] : The user selects the IP address set method for use with TCP/IP. The user selects from among "IP(I)" "RARP (R)" and "BOOTP (B)".

- [IP address (P)] : The user enters an IP address from 0 to 255 in base10 in 4 segments for use with TCP/IP.
10 This function is only valid when "IP (I)" is selected with [IP address set method].

- [Subnet mask (M)] : The user enters a subnet mask from 0 to 255 in base10 in 4 segments for use with TCP/IP. This function is only valid when other than "BOOTP(P)" is
15 selected with [IP address set method].

 [Gateway address (G)] : The user enters a gateway address from 0 to 255 in base10 in 4 segments for use with TCP/IP. This function is only valid when other than "BOOTP(B)" is selected with [IP address set method].

- 20 [BOOTP address] : The user enters a gateway address from 0 to 255 in base10 in 4 segments for use with TCP/IP. This function is only valid when "BOOTP(B)" is selected with [IP address set method].

[Broadcast address] : Displays the 0 or 255
broadcast address for use with TCP/IP.

[Print service (S)] : The user selects the print
service used with TCP/IP. The user selects from among "None"
5 and "LPD".

[Standard (D)] button : Returns to the preset
standard values. Writes all standard values held by NetSpot.

[OK] button : The user selects this button to close
the dialog box. When changes have been made in the settings,
10 the network interface board settings are updated.

[Cancel] button : The user selects this button to
invalidate the settings that were made and close the dialog
box.

[Update (A)] button : When changes have been made
15 in the settings, the network interface board settings are
updated. This [Update (A)] button can only be used when
changes in the settings have been made.

[Help (H)] button : The user selects this button
to display the online help.

20 Other operations :

When the user enters a value higher than 256 in
[IP address (P)] or [Subnet mask (M)] or in [Gateway address
(G)] the message in Fig. 115 appears and the display returns
to the Protocol Set Dialog Box (Fig. 144). When the user has

selected, the soft reset of the network interface board is not performed.

When the user at the same time makes settings in [Name (E)] of the AppleTalk Set Sheet (Fig. 120), soft reset
5 of the network interface board is performed after waiting per the displayed message status.

On the TCP/IP Set Sheet (Fig. 114), when changes have been in made to the [Frame type (F)] or [IP address set method] or [IP address (P)] or [Subnet mask (M)] or the
10 [Gateway address (G)] settings by the user and the protocol settings on the network interface board completed, once the soft reset of the network interface board is selected, the message in Fig. 119 is displayed just prior to the soft reset of the network interface board during TCP/IP operation by
15 NetSpot. When the user selects the [Yes (Y)] button in the dialog of Fig. 119, after soft reset of the network interface board is performed, the device window (Fig. 43) closes. When the user selects the [No (N)] button, the device window (Fig. 43) does not close after soft reset of the network interface
20 board is performed.

[AppleTalk Set Sheet (Fig. 120)]

When the tab indicating [AppleTalk] on the upper part of the Protocol Set Dialog Box (Fig. 144) is clicked, NetSpot display the AppleTalk Set Sheet shown in Fig. 120.

This AppleTalk Set Sheet is for setting information relating to AppleTalk for the device that the user selected.

Detailed Specifications

[Frame type (F)] : The user selects this item to
5 choose the AppleTalk frame type. The user selects from among :
"Invalid" and "Phase2".

[Network No. (N)] : Displays the network No. in
integers from 0 to 65535 for use with AppleTalk. The [Phase
type (F)] value acquired from the network interface board
10 is only valid for "Phase2". A display of the currently set
values is shown.

[Node address] : Integers from 0 to 255 for display
as node No.s for use with AppleTalk are displayed. The [Phase
type (F)] value acquired from the network interface board
15 is only valid for "Phase2". A display of the currently set
values is shown.

[Name (E)] : The user inputs the object name in
a character string from 1 to 32 spaces for use with AppleTalk.
The [Phase type (F)] value acquired from the network
20 interface board is only valid for "Phase2". A display of the
currently set values is shown. When the user changes settings
and the network interface board settings were updated, the
network interface board must not be reset for several
seconds.

[Zone] : Displays the zone name for use with AppleTalk.

[Type] : Displays the "LasershotLT" type name for use with AppleTalk. The [Phase type (F)] value acquired from
5 the network interface board is only valid for "Phase2". A display of the currently set values is shown.

[Standard (D)] button : Returns to the preset standard values. Writes all standard values held by AppleTalk.

10 [OK] button : The user selects this button to close the dialog box. When changes have been made in the settings, the network interface board settings are updated.

[Cancel] button : The user selects this button to invalidate the settings that were made and close the dialog
15 box.

[Update (A)] button : When changes have been made in the settings, the network interface board settings are updated. This [Update (A)] button can only be used when changes in the settings have been made.

20 [Help (H)] button : The user selects this button to display the online help.

Other operations :

In [Name (E)] the four character codes of "=" ":"
"*" and "@" cannot be input. If the user enters a two byte

character code containing "=" ":" "*" or "@" in [Name (E)], then the message in Fig. 121 appears and the display returns to the Protocol Set Dialog Box (Fig. 144).

When the user has changed any of the settings in the AppleTalk Sheet (Fig. 120) and clicked the [OK] button, the message in Fig. 122 is displayed. When the user selects the [Yes (Y)] button in the dialog of Fig. 122, the protocol settings of the network interface board are changed and the Protocol Set Dialog Box (Fig. 144) closes. When [No (N)] is selected, the Protocol Set Dialog Box (Fig. 144) closes with no other operations performed. When the [Cancel] button is selected, the display returns to the Protocol Set Dialog Box (Fig. 144) with no other operations performed.

When the user has changed any of the settings in the AppleTalk Sheet (Fig. 120) and clicked the [Update (A)] button, the message in Fig. 123 is displayed. When the user selects the [Yes (Y)] button in the dialog of Fig. 123, the protocol settings of the network interface board are changed and the Protocol Set Dialog Box (Fig. 144) closes. When the user selects [No (N)], the Protocol Set Dialog Box (Fig. 144) returns with no other operations performed.

The message in Fig. 124 appears when settings required for soft reset have been completed by the user on the AppleTalk Set Sheet (Fig. 120). When the user selects

the [Yes (Y)] button in the dialog of Fig. 124, soft reset of the network interface board is performed. When [No (N)] is selected, the soft reset of the network interface board is not performed.

- 5 When the user at the same time makes settings in [Name (E)] of the AppleTalk Set Sheet (Fig. 120), preferably soft reset of the network interface board should be performed after waiting for several seconds in the status of the displayed message shown in Fig. 124.

- 10 [Device Window Menu Function (See Fig. 43)]

The Device Window (Fig. 43) Menu Bar (817 to 822) provides the menu functions shown in Table 16 and Table 17 in controller mode and general user mode.

Table 16
List(1) of menu functions supported by the device window

ITEM NO.	FUNCTION	Admin	User
1	Printer control <ul style="list-style-type: none"> · Online control (online/offline) ([Device] - [Online]) ([Device] - [Offline]) · Paper eject ([Device]-[Paper eject]) · Printer reset ([Device] - [Printer reset]) · Return to printer environment default settings ([Device] - [Printer default]) 	○	
2	Network interface board control <ul style="list-style-type: none"> · Network interface board reset ([Device]-[Network interface board reset]) · Return to network interface board reset default settings ([Device] - [Network interface board reset default settings]) 	○	
3	Quitting device window <ul style="list-style-type: none"> · Close device window (Fig. 43) ([Device] - [Close]) or ([File] - [Close]) 	○	○
4	Display menu <ul style="list-style-type: none"> · Switch sheets ([Display] - [Status]/ [Job] - [Information]/[Network]) · Update information of each item ([Display] - [Update info]) 	○	○
5	Trap report condition set menu <ul style="list-style-type: none"> · Select trap report conditions ([Set] - [Trap report]) 	○	
6	Display auto change set menu <ul style="list-style-type: none"> · Auto change select & Change interval device windows ([Set] - [Printer auto change...]) 	○	○
7	Printer info set menu ([Set] - [Printer info...]) <ul style="list-style-type: none"> · Display product name · Set printer name · Set installation location 	○	

[Set (S)] - [Printer (P)...] : Opens the Printer Environment Set Dialog Box (Fig. 143) for the user to set the printer environment information (controller mode only).

[Set (S)] - [Protocol (L)...] : Opens the Protocol Set Dialog Box (Fig. 144) for the user to set the protocol (controller mode only).

[Set (S)] - [Change device password (W) ...] : Opens the Device Password Change Dialog Box (Fig. 137) for the user to change the password when the device window (Fig. 43) is open (controller mode only).

[Test (T)] [Test print (P)] : Implements a joint test print (controller mode only). Implements the joint test print after being set offline.

[Test (T)] [Status print (P)] : Implements a joint status print (controller mode only). Implements the joint status print after being set offline.

[Test (T)] [Font list (F)] : Implements output of a joint font list (controller mode only). Implements the joint font list printout after being set offline.

[Help (H)]-[Index (C)] : Displays the NetSpot online help index.

[Help (H)]-[Search with keyword (S)...] : Displays NetSpot online help keyword search.

[Help (H)]-[Version info (A)...] : Opens the Device Version Information Dialog Box (Fig. 141) for displaying the device version information.

Other operations :

5 The message shown in Fig. 125 appears when if the printer is in online status when [Device (D)]-[Eject paper (E)] is selected. If the [OK] button is selected by the user in the dialog of Fig. 125, then the printer paper is ejected after setting the printer offline and the display returns
10 to the device window (Fig. 43). When the [Cancel] button is selected and the display returns to the device window (Fig. 43) with no other operations performed.

 The message in Fig. 126 appears when the user selects [Device (D)]-[Printer reset (R)]. When the user
15 selects the [OK] button with "Hard reset (R)" set to ON in the dialog of Fig. 126, then hard reset of the printer is performed and the display returns to the device window (Fig. 43). When the user sets the "Hard reset (R)" to OFF and selects the [OK] button, soft reset of the printer is performed and
20 the display returns to the device window (Fig. 43). When the [Cancel] button is selected and the display returns to the device window (Fig. 43) with no other operations performed.

 When [Device (D)]-[Printer reset (I)] is selected, the message in Fig. 127 appears. When the user selects the

When the user selects [Test (T)]-[Test print (P)] or [Test (T)]-[Status print (S)] or [Test (T)]-[Font list (F)] while the printer was set offline, the message in Fig. 131 appears. When the user selects the [OK] button in the dialog of Fig. 131, the joint test print or the font list output or the joint status print are implemented after the printer has been set offline, and the display returns to the device window (Fig. 43). When the [Cancel] button is selected and the display returns to the device window (Fig. 43) with no other operations performed.

[Trap Report Condition Dialog Box (See Fig. 132)]

When the [Set (S)]-[Trap report] menu of the device window (Fig. 43) is selected by the user, NetSpot displays the Trap Report Condition Dialog Box of Fig. 132. This Trap Report Condition Dialog Box (Fig. 132) is for setting trap report conditions. This Trap Report Condition Dialog Box is only applicable for the controller mode.

Detailed Specifications

[Report on changed conditions (S)] : The user
20 selects whether to report on a trap when status (operating
panel message) has changed. The user selects either ON or
OFF.

[Report when error occurs (E)] : The user selects whether to report on a trap when an error has occurred. The user selects either ON or OFF.

[OK] button : The user selects this button to
5 validate the settings and close the dialog box. When changes have been made in the settings, the printer settings are updated.

[Cancel] button : The user selects this button to
10 invalidate the settings that were made and close the dialog box.

[Update (A)] button : When changes have been made in the settings, the printer settings are updated. This [Update (A)] button can only be used when changes in the settings have been made.

15 [Help (H)] button : The user selects this button to display the online help.

[Device Display Auto Change Dialog Box (See Fig. 133)]

The Device Display Auto Change Dialog Box of Fig.
20 133 is shown by NetSpot when the user selects the [Set]-[Display auto change...] menu of the device window (Fig. 43). This Device Display Auto Change Dialog Box of Fig. 133 is for setting the auto change interval on the display in the device window (Fig. 43).

Detailed Specifications

[Automatically update display (A)] : The user selects whether or not to automatically change (update) the device display. The user selects either ON or OFF.

- 5 [Change interval (I)] : The user inputs a change interval between 10 and 600 seconds. This function is only valid when [Automatically update display (A)] is set to ON.

 [OK] button : The user selects this button to validate the settings and close the dialog box.

- 10 [Cancel] button : The user selects this button to invalidate the settings that were made and close the dialog box.

 [Help (H)] button : The user selects this button to display the online help.

- 15 Other operations :

 When a value other than 10 to 600 seconds is entered in [Change Interval], the message in Fig. 134 appears and the display returns to the Device Display Auto Change Dialog Box (Fig. 133).

- 20 [Printer Information Set Dialog Box (See Fig. 135)]

 NetSpot displays the Printer Information Set Dialog Box shown in Fig. 135 when the user selects the [Set]-[Printer info...] menu of the device window (Fig. 143).

This Printer Information Set Dialog Box (Fig. 135) is for setting the printer information. The Printer Information Set Dialog Box (Fig. 135) is only applicable to the controller mode.

5 Detailed Specifications

[Product name] : Display the product name in a character string from 0 to 63 spaces.

[Printer name (N)] : The user enters the printer product name in a character string from 0 to 63 spaces.

10 [Installation location (L)] : The user enters the printer installation location in a character string from 0 to 63 spaces.

[OK] button : The user selects this button to validate the settings and close the dialog box. When changes
15 have been made in the settings, the device settings are updated.

[Cancel] button : The user selects this button to invalidate the settings that were made and close the dialog box.

20 [Update (A)] button : When changes have been made in the settings, the device settings are updated. This [Update (A)] button can only be used when changes in the settings have been made.

[Help (H)] button : The user selects this button to display the online help.

[Controller Info Setting Dialog Box (See Fig. 136)]

5 The Controller Info Setting Dialog Box is shown by NetSpot in Fig. 136 when the user selects the [Set]-[Controller info...] from the device window (Fig. 43). This Controller Info Setting Dialog Box of Fig. 136 is for setting the controller information. This Controller Info Setting
10 Dialog Box is only applicable in controller mode.

Detailed Specifications

[Name] : The user enters the controller name in a character string from 0 to 63 spaces.

[Address (T)] : The user enters the controller
15 address in a character string from 0 to 63 spaces.

[Comment (C)] : The user enters a comment on the controller in a character string from 0 to 63 spaces.

[OK] button : The user selects this button to validate the settings and close the dialog box. When changes
20 have been made in the settings, the device settings are updated.

[Cancel] button : The user selects this button to invalidate the settings that were made and close the dialog box.

[Update (A)] button : When changes have been made in the settings, the device settings are updated. This [Update (A)] button can only be used when changes in the settings have been made.

5 [Help (H)] button : The user selects this button to display the online help.

[Device Password Change Dialog Box (See Fig. 137)

NetSpot displays the Device Password Change Dialog Box of Fig. 173 when the user selects the [Set]-[Change device
10 window...] menu of the device window (Fig. 43) .This Device Password Change Dialog Box of Fig. 137 is for changing the device password. This Device Password Change Dialog Box (Fig. 137) is only applicable in controller mode.

Detailed Specifications

15 [Old password (O)] : The user enters here the old device password when opening the device window (Fig. 43) in a character string of 0 to 15 spaces. Large letters and small letters are handled separately.

[New password (N)] : The user enters here the new
20 device password when opening the device window (Fig. 43) in a character string of 0 to 15 spaces. This function is only valid when [Use NetSpot password (S9)] is set to OFF. Large letters and small letters are handled separately.

[Check new password (F)] : The user reenters here the new device password used when opening the device window (Fig. 43) in a character string of 0 to 15 spaces. This function is only valid when [Use NetSpot password (S9)] is
5 set to OFF. Large letters and small letters are handled separately.

[Use NetSpot password (S)] : The user selects whether or not to use the NetSpot password as the new password. The user selects either ON or OFF.

10 [OK] button : The user selects this button to validate the settings and close the dialog box. When changes have been made in the settings, the device settings are updated.

[Cancel] button : The user selects this button to
15 invalidate the settings that were made and close the dialog box.

[Help (H)] button : The user selects this button to display the online help.

Other operations :

20 When the user makes a mistaken password entry in [Old password (O)], the message in Fig. 138 is displayed and the display returns to the Device Password Change Dialog Box (Fig. 137).

When the new password of [New password (N)] entered by the user does not match the new device password reentered with [Check new password (F)], then the message in Fig. 139 appears and the display returns to the Device Password Change Dialog Box (Fig. 137). When the device password is changed by the user entering the correct password, the message in Fig. 140 appears and the display returns to the Device Password Change Dialog Box (Fig. 43).

[Device Version Information Dialog Box (See Fig. 141)]

NetSpot displays the Device Version Information Dialog Box of Fig. 141 when the user selects the [Help]-[Version info] menu of the device window in Fig. 43. This Device Version Information Dialog Box (Fig. 141) is for displaying the device version information.

Detailed Specifications

[Version information] : Displays the product title and name. This item shows the copyright. Displays the SNMP version used by this device.

[OK] button : Closes the dialog box.

[Error Popup Window (See Fig. 142)]

When an error occurs in the device opened in the device window (Fig. 43), an Error Popup Window is displayed in Fig. 142 to show an error has occurred. A detailed message

message sent. Therefore, in general user mode in NetSpot the error popup window may sometimes not occur due to the positional relation between NetSpot general user mode and the device on the network.

5 Detailed Specifications

[Error contents] : Displays details of the error that occurred.

[OK] button : Closes the dialog box.

[Help (H)] button : Displays the online help.

10

MIB Data Read-out Method

The MIB data read-out method in the network printer management software of this embodiment is next explained while referring to the flowchart shown in Fig. 161.

15 The start of MIB data read-out is shown in Step S16100.

An MIB data read-out request is made by the network printer management software to the SNMP agent on the network printer in Step S16101. This MIB data read-out request
20 utilizes the GetRequest-PDU (Protocol Data Unit) and the GetNextRequest-PDU (see RFC 1157). The assembly of these PDUs is performed by an MIB module 610 in Fig. 6 and afterwards an SNMP module 611 performs coding conforming to the SNMP transmit format.

Next, in Step S16102, a read-out report on the MIB data that was requested by the SNMP agent on the network printer to the network printer management software. The MIB data read-out report is utilized by the GetResponse-PDU (See 5 RFC 1157). This GetResponse-PDU includes the MIB data read-out values. This GetResponse-PDU is analyzed by the MIB module 610 after decoding by the SNMP module 611.

Next in Step S16103, utilizing the MIB data reported in Step S16102, the cache values of the MIB data 10 stored in an MIB data cache D15201 are changed. Here, the MIB data cache D16101 is maintained in part of the data storage zones of RAM503 or the hard disk (HD) 511 as shown in the hardware structure in Fig. 5.

The process of Fig. 161 then ends in Step S16104.
15 MIB Data Write Method

The MIB data write method in the network printer management software of this embodiment is next explained while referring to the flowchart shown in Fig. 162.

The start of MIB data read-out is shown in Step 20 S16200.

In Step 16201, whether to compare the MIB write-specified data values with the MIB data cache values is determined. The reason this step is needed is that some items are essential for writing while some read-out values

have little significance so that a comparison of this MIB data with cache value may not be useful.

In Step S16201, when determined that the write-specified MIB data values should be compared against
5 the MIB data cache values, the process proceeds to Step S16202. Conversely, the process proceeds to Step S16204 when determined these two data types should not be compared.

In Step 16202, the MIB data cache values matching the write-specified MIB data, are read-out from the data
10 cache D16201.

Then in Step S16203, the MIB data cache values are compared against the write-specified MIB data values and when determined that these values are not equivalent, the process proceeds to Step S16204. Conversely, when determined that
15 these values are equivalent, the process proceeds to Step S16207 and the process of Fig. 162 then ends.

In Step 16204, an MIB data write request is made to the SNMP agent on the network from the network printer management software. This MIB data write request utilizes
20 SetRequest-PDU (See RFC 1157). An MIB module 610 shown in Fig. 6 arranges this Set-Request-PDU and afterwards, an SNMP module 611 performs coding in conformance with the SNMP transmit format.

Next, in Step S16205, an MIB data write report request is made from the SNMP agent on the network to the network printer management software. This MIB data write report utilizes Get-Response-PDU (See RFC 1157). This

5 Get-Response-PDU includes written MIB data values. This Get-Response-PDU is analyzed by the MIB module 610 after decoding by an SNMP module 611.

In the subsequent Step S15306, the MIB data cache values stored in the cache D15201 (See description for Fig. 10 161) of the MIB data are changed by utilizing the MIB data reported in Step 16205.

Then in Step 16207, the process of Fig. 162 then ends.

The above process, functions on network controlled
15 equipment. Consequently, the cache memory is held in common
by the entire network.

In this embodiment therefore, as explained above, a step is provided in network printer management software utilizing SNMP protocol, to distinguish between MIB data requiring a write request and MIB data not requiring a write request for an SNMP agent in a network printer from among MIB data corresponding to user write-specified information; so that write requests for MIB data not required by the SNMP agent on the network printer are therefore not performed.

Consequently, the above process allows the amount of network traffic (data flow rate) and the load (amount of work) applied to the network printer to be reduced.

Further, by providing a step to store in the MIB data cache, MIB data obtained in the MIB data read-out process and a step to compare MIB data in the MIB write process matching write-specified information from the user against the MIB data stored in the cache in the previous step; the MIB data requiring a write request can be distinguished from MIB data not requiring a write request for an SNMP agent in a network printer from among MIB data corresponding to user write-specified information, and write requests will therefore not be made for MIB data not required by the SNMP agent on the network printer. Accordingly, the above process allows the amount of network traffic (data flow rate) and the load (amount of work) applied to the network printer to be reduced.

Alternatively, by providing a step to store in the MIB data cache, written MIB data obtained in the MIB data write process and a step to compare MIB data of the MIB write process matching write-specified information from the user against the MIB data store in the cache in the previous step; the MIB data requiring a write request can be distinguished from MIB data not requiring a write request for an SNMP agent

in a network printer from among MIB data corresponding to user write-specified information, and write requests will therefore not be made for MIB data not required by the SNMP agent on the network printer. Accordingly, the above process
5 allows the amount of network traffic (data flow rate) and the load (amount of work) applied to the network printer to be reduced.

Still further, by providing a step to store in the MIB data cache, MIB data obtained in the MIB data read-out
10 process and a step to store MIB data written in the write process into the MIB data cache, along with a step to compare MIB data of the MIB write process that matches write-specified information from the user against the MIB data stored in the cache in either of the previous steps; the MIB
15 data requiring a write request can be distinguished from MIB data not requiring a write request for an SNMP agent in a network printer from among MIB data corresponding to user write-specified information, and write requests will therefore not be made for MIB data not required by the SNMP
20 agent on the network printer. Accordingly, the above process allows the amount of network traffic (data flow rate) and the load (amount of work) applied to the network printer to be reduced.

In this invention therefore, as explained above,
not all MIB objects under the control of the network
management software are acquired simultaneously during
startup of the network management software. Consequently,
5 the flow of a large volume of SNMP packets in the LAN will
cease and along with a simultaneous reduction in load on
channels, the load on the devices such as the printer and
network board controlling that process these SNMP packets
will become small.

10 Further by providing a network data base control
device and method that creates only a small load on the LAN,
printer and network boards, the time required to start up
(display initial menu) the network management software will
be drastically shortened and the user will thus be provided
15 with an easier operating environment.

Also, in network printer management software
utilizing SNMP protocol, there will be no processing of
change or write requests for unneeded MIB data, while write
requests for necessary MIB data for SNMP agents of the device
20 (such as printers) on the network matching write-specified
information from the user will be processed, thus allowing
the amount of network traffic (data flow rate) and the load
(amount of work) applied to the network printer to be reduced.

As many apparently widely different embodiments
of the present invention can be made without departing from
the spirit and scope of the present invention, it is
understood that this invention is not limited to the specific
5 embodiments thereof except as defined in the appended claims.

0901295 020293
862020 5627060

WHAT IS CLAIMED IS:

1. A network device control method comprising:
an initial sheet information acquisition and display
5 step of acquiring and displaying initial sheet information
on an initial screen of a device window which is a window
allocated to individual network peripheral devices on a one
to one basis for controlling network devices; and
a different sheet information acquisition and display
10 step of acquiring and displaying different types of sheet
information on a device window when determined that a user
has requested display of different type sheet information.
2. A network device control unit comprising :
15 initial sheet information acquisition and display
means for acquiring and displaying initial sheet information
on an initial screen of a device window which is a window
allocated to individual network peripheral devices on a one
to one basis for controlling network devices; and
20 different sheet information acquisition and display
means for acquiring and displaying different types of sheet
information on a device window when determined that a user
has requested display of different type sheet information.

3. A recording medium capable of being read by a computer in which programs are stored, said programs including:

initial sheet information acquisition and display step of acquiring and displaying initial sheet information on an
5 initial screen of a device window which is a window allocated to individual network peripheral devices on a one to one basis for controlling network devices; and

a different sheet acquisition and display step of acquiring and displaying different types of sheet
10 information on a device window when determined that a user has requested display of different type sheet information.

4. A network device control method comprising:

an initial sheet information acquisition and display
15 step of acquiring and displaying initial sheet information on an initial screen of a device window which is a window allocated to individual network peripheral devices on a one to one basis;

a separate sheet information list making step to make
20 a list of separate sheet information not consisting of the initial sheet information acquired and displayed in said initial sheet information acquisition and display step;

an acquisition sheet information decision step to decide the sheet information list to acquire from the

separate sheet information lists made in said separate sheet information list making step;

5 a different sheet information acquisition and display step of acquiring and displaying different types of newly requested sheet information on a device window opened by said initial sheet information acquisition and display step, when determined that an entry was made by a user requesting display of different type sheet information;

10 an all sheet information acquisition decision step of deciding whether all sheet information is acquired;

15 a single sheet information acquisition decision step to decide whether all acquisition of sheet information from currently acquired sheet information has ended as determined in said acquisition sheet information decision step when found in said all sheet information acquisition decision step that not all information was acquired;

20 a sheet information list status change step to change the sheet information list status of previously acquired information when decided by means of said single sheet information acquisition decision step that all current acquisition of sheet information has ended; and

a network device information acquisition step of acquiring network device information when decided by means of said single sheet information acquisition step, that not

all current acquisition of sheet information has ended.

5. A network device control unit comprising:

initial sheet information acquisition and display

5 means for acquiring and displaying initial sheet information
on an initial screen of a device window which is a window
allocated to individual network peripheral devices on a one
to one basis;

a separate sheet information list making means to make
10 a list of separate sheet information not consisting of the
initial sheet information acquired and displayed in said
initial sheet information acquisition and display means;

acquisition sheet information decision means to decide
the sheet information list to acquire from the separate sheet
15 information lists made in said separate sheet information
list making means;

different sheet acquisition and display means for
acquiring and displaying different types of newly requested
sheet information on a device window opened by said initial
20 sheet information acquisition and display means, when
determined that an entry was made by the user requesting
display of different type sheet information;

all sheet information acquisition decision means for
deciding whether all sheet information is acquired;

single sheet information acquisition decision means to decide whether acquisition of all sheet information from the currently acquired sheet information has ended as determined in said acquisition sheet information decision
5 means, when found in said all sheet information acquisition decision that not all sheet information is acquired;

sheet information list status change means to change the sheet information list status of previously acquired information when decided by means of said single sheet
10 information acquisition decision means that all current acquisition of sheet information has ended; and

network device information acquisition means for acquiring network device information when decided by way of said single sheet information acquisition means, that not
15 all current acquisition of sheet information has ended.

6. A recording medium capable of being read by a computer in which programs are stored, said programs including:

initial sheet information acquisition and display step
20 of acquiring and displaying initial sheet information on an initial screen of a device window which is a window allocated to individual network peripheral devices on a one to one basis;

a separate sheet information list making step to make

a list of separate sheet information not consisting of the initial sheet information acquired and displayed in said initial sheet information acquisition and display step;

an acquisition sheet information decision step to

5 decide the sheet information list to acquire from the separate sheet information lists made in said separate sheet information list making step;

a different sheet information acquisition and display step of acquiring and displaying different types of newly

10 requested sheet information on a device window opened by said initial sheet information acquisition and display step, when determined that an entry was made by the user requesting display of different type sheet information;

an all sheet information acquisition decision step of

15 deciding whether all sheet information is acquired;

a single sheet information acquisition decision step to decide whether acquisition of all sheet information from currently acquired sheet information has ended as determined in said acquisition sheet information decision step when

20 found in said all sheet information acquisition decision step that not all information is acquired;

sheet information list status change step to change the sheet information list status of previously acquired information when decided by means of said single sheet

information acquisition decision step that all current acquisition of sheet information has ended; and

a network device information acquisition step of acquiring network device information when decided by means of said single sheet information acquisition step, that not
5 all current acquisition of sheet information has ended.

7. A network device control method according to claim 1 or claim 4, wherein said initial sheet information acquisition and display step comprising:
10

an initial sheet information specifying step of specifying initial sheet information;

a sheet information list making step to make a serial information list from initial sheet information specified
15 in said initial sheet information specifying step; and

an information acquisition step of requesting, acquiring and displaying information for the network device based on the sheet information list made in said sheet information list making step.

20

8. A network device control unit according to claim 2 or claim 5, wherein said initial sheet information acquisition and display means comprising:

initial sheet information specifying means for

specifying initial sheet information;

sheet information list making means to make a serial information list from initial sheet information specified in said initial sheet information specifying means; and

5 information acquisition means for requesting, acquiring and displaying information for the network device based on the sheet information list made in said sheet information list making means.

10 9. A recording medium according to claim 3 or claim 6, wherein said initial sheet information acquisition and display step comprising:

an initial sheet information specifying step of specifying initial sheet information;

15 a sheet information list making step to make a serial information list from initial sheet information specified in said initial sheet information specifying step; and

an information acquisition step of requesting, acquiring and displaying information for the network device
20 based on the sheet information list made in said sheet information list making step.

10. A network device control method according to claim 7, wherein the user specifies initial sheet information on an

initial sheet information screen as said initial sheet information specifying step.

11. A network device control method according to claim 7,
5 wherein said initial sheet information specifying step comprises a network device status identifier of for determining the status of the network device, and a status initial sheet set step to set the displayed initial sheet information by way of the network device status determined
10 in said network device status identifier step.

12. A network device control unit according to claim 8,
wherein said initial sheet information specifying means comprises the network device control unit specifying initial
15 sheet information in a fixed pattern.

13. A network device control unit according to claim 8,
wherein said initial sheet information specifying means specifies the initial sheet information by utilizing an
20 initial sheet information identifier to identify initial sheet information held in the initialize file stored in the storage means of said network device.

14. A network device control unit according to claim 13,

wherein as means to hold sheet information in said initialize
file, the immediately prior used network device control unit
of this invention holds the identifier for the sheet
information acquired and displayed most recently, in the
5 initialize file.

15. A network device control unit according to claim 8,
wherein as said initial sheet information specifying means,
the user specifies the initial sheet information when using
10 the network device control unit.

16. A network device control unit according to claim 8,
wherein said initial sheet information specifying means
comprises network device status identifier means for
15 determining the status of the network device, and status
initial sheet set means to set the displayed initial sheet
information by way of the network device status determined
in said network device status identifier means.

20 17. A recording medium according to claim 9, wherein said
initial sheet information specifying step includes a program
of specifying initial sheet information in a fixed pattern.

18. A recording medium according to claim 9, wherein said

initial sheet information specifying step specifies the initial sheet information by utilizing an initial sheet information identifier to identify initial sheet information held in the initialize file stored in said recording medium.

5

19. A recording medium according to claim 18, wherein as a method to hold sheet information in said initialize file, the immediately prior used network device control unit of this invention holds the identifier for the sheet information acquired and displayed most recently, in the initialize file.

10

20. A recording medium according to claim 9, wherein as said initial sheet information specifying step, the user specifies initial sheet information on an initial sheet information screen.

15

21. A recording medium according to claim 9, wherein said initial sheet information specifying means consists of network device status identifier means for determining the status of the network device, and

20

status initial sheet set means to set the displayed initial sheet information by way of the network device status determined in said network device status identifier means.

22. A network device control method according to claim 1 or claim 4, wherein said separate sheet information acquisition and display step comprising:

- an separate sheet information specifying step of
- 5 specifying separate sheet information;
- a sheet information list making step to make a serial information list from separate sheet information specified in said separate sheet information specifying step; and
- an information acquisition step of requesting,
- 10 acquiring and displaying information for the network device based on the sheet information list made in said sheet information list making step.

23. A network device control unit according to claim 2 or claim 5, wherein said separate sheet information acquisition and display means comprising:

- separate sheet information specifying means for specifying separate sheet information;
- sheet information list making means to make a serial
- 20 information list from separate sheet information specified in said separate sheet information specifying means; and
- information acquisition means for requesting,
- acquiring and displaying information for the network device based on the sheet information list made in said sheet

information list making means.

24. A recording medium according to claim 3 or claim 6,
wherein said initial sheet information acquisition and
5 display step comprising:

an separate sheet information specifying step of
specifying separate sheet information;

a sheet information list making step to make a serial
information list from separate sheet information specified
10 in said separate sheet information specifying step; and

an information acquisition step of requesting,
acquiring and displaying information for the network device
based on the sheet information list made in said sheet
information list making step.

15

25. A network device control method according to claim 7 ,
wherein said initial sheet information acquisition step
comprising:

a sheet information compulsory acquisition decision
20 step of deciding whether or not to compulsorily acquire sheet
information;

an instant display step to display a portion of the
information beforehand based on the currently held sheet
information, when decided not to perform compulsory

acquisition in said sheet information compulsory acquisition
decision step;

a display all sheet information step to decide whether
or not all sheet information was displayed when decided to
5 perform compulsory acquisition in said sheet information
compulsory acquisition decision step;

a network device information acquisition step of
acquiring network device information;

a network device holding decision step to decide
10 whether or not previously acquired network device
information (hereafter called "cache") is being held;

a cache comparison step to compare the cache value with
the network device information value newly acquired by way
of said network device acquisition step when determined to
15 hold in cache by said network device holding decision step;

a cache value hold step to hold the acquired network
device information as a cache value when results of the
comparison of the cache value with the newly acquired network
device information value are determined to differ and also
20 when decided a cache is not being held by way of said network
device holding decision step;

a network device information display step to display
on said device window, said cache value held in said cache
value hold step;

instant display means to display a portion of the information beforehand based on the currently held sheet information, when decided not to perform compulsory acquisition in said sheet information compulsory acquisition
5 decision means;

display all sheet information means to decide whether or not all sheet information was displayed when decided to perform compulsory acquisition in said sheet information compulsory acquisition decision means;

10 network device information acquisition means for acquiring network device information;

network device holding decision means to decide whether or not previously acquired network device information (hereafter called "cache") is being held;

15 cache comparison means to compare the cache value with the network device information value newly acquired by way of said network device acquisition means when determined to hold in cache by said network device holding decision means;

cache value hold means to hold the acquire network
20 device value as a cache value when results of the comparison of the cache value with the newly acquired network device information value are determined to differ and also when decided a cache is not being held by way of said network device holding decision means;

network device information display means to display on said device window, said cache value held in said cache value hold means;

5 sheet list status change means to change the status of currently displayed information on the sheet list to display-completed status in order to decide whether to display all network device information in said display all sheet information means;

10 update decision means to decide whether or not to update the display of information on said device window when decided all network device information was displayed in display all sheet information means;

15 timer update set means to set an automatic update timer when determined to perform automatic updates in the update decision means;

timer update monitor means to determine whether or not the time is up, on the automatic update timer set in said timer update set means; and

20 update stop monitor means to monitor if updating has stopped or not when the time has not run out on the automatic update timer monitored in the timer update monitor means.

27. A recording medium according to claim 9, wherein said initial sheet information acquisition step comprising:

a sheet information compulsory acquisition decision step of deciding whether or not to compulsorily acquire sheet information;

an instant display step to display a portion of the
5 information beforehand based on the currently held sheet information, when decided not to perform compulsory acquisition in said sheet information compulsory acquisition decision step;

a display all sheet information step to decide whether
10 or not all sheet information was displayed when decided to perform compulsory acquisition in said sheet information compulsory acquisition decision step;

a network device information acquisition step of acquiring network device information;

15 a network device holding decision step to decide whether or not previously acquired network device information (hereafter called "cache") is being held;

a cache comparison step to compare the cache value with the network device information value newly acquired by way
20 of said network device acquisition step when determined to hold in cache by said network device holding decision step;

a cache value hold step to hold the acquire network device value as a cache value when results of the comparison of the cache value with the newly acquired network device

information value are determined to differ and also when decided a cache is not being held by way of said network device holding decision step;

5 a network device information display step to display on said device window, said cache value held in said cache value hold step;

10 a sheet list status change step to change the status of currently displayed information on the sheet list to display-completed status in order to decide whether to display all network device information in said display all sheet information step;

15 an update decision step to decide whether or not to update the display of information on said device window when decided all network device information was displayed in display all sheet information step;

a timer update set step to set an automatic update timer when determined to perform updates in the automatic update decision step;

20 a timer update monitor step to determine whether or not the time is up, on the automatic update timer set in said timer update set step; and

an update stop monitor step to monitor if updating has stopped or not when the time has not run out on the automatic update timer monitored in the timer update monitor step.

28. A network device control method according to claim 25, wherein said instant display step comprising:

a sheet information list decision step of deciding
 5 whether the three steps of a cache value enable decision step, a network device information display step and a sheet information list status change step were implemented on the currently held sheet information list;

a cache value enable decision step to decide whether
 10 information in said sheet information list was previously acquired, when determined by utilizing the sheet information list decision step, that said cache value enable decision step and the two steps of network device information display step and sheet information list status change step were not
 15 implemented for the entire sheet information list;

a network device information display step to display
 a cache value of certain information on said device window when determined that the information was previously acquired by way of said cache value enable decision step; and
 20 sheet list status change step to change the status of currently displayed information on the sheet list to display-completed status.

29. A network device control unit according to claim 26,

wherein said instant display means comprising:

sheet information list decision means for deciding whether the three means of a cache value enable decision means, a network device information display means and a sheet
5 information list status change means were implemented on the currently held sheet information list;

cache value enable decision means to decide whether information in said sheet information list was previously acquired, when determined by utilizing the sheet information
10 list decision means, that said cache value enable decision means and the two means of network device information display means and sheet information list status change means were not implemented for the entire sheet information list;

network device information display means to display
15 a cache value of certain information on said device window when determined that the information was previously acquired by way of said cache value enable decision means; and

sheet list status change means to change the status of currently displayed information on the sheet list to
20 display-completed status.

30. A recording medium according to claim 27, wherein said instant display step comprising:

a sheet information list decision step of deciding

whether the three steps of a cache value enable decision step,
a network device information display step and a sheet
information list status change step were implemented on the
currently held sheet information list;

5 a cache value enable decision step to decide whether
information in said sheet information list was previously
acquired, when determined by utilizing the sheet information
list decision step, that said cache value enable decision
step and the two steps of network device information display
10 step and sheet information list status change step were not
implemented for the entire sheet information list;

a network device information display step to display
a cache value of certain information on said device window
when determined that the information was previously acquired
15 by way of said cache value enable decision step; and

a sheet list status change step to change the status of currently displayed information on the sheet list to display-completed status.

20 31. A network device control method according to claim 7 ,
wherein said information acquisition step comprising:

```

    a display all sheet information decision step to decide
whether or not to all sheet information was displayed;

```

a network device information hold decision step to

of currently displayed information on the sheet list to display-completed status in order to decide whether to display all network device information in said display all sheet information step;

5 an update decision step to decide whether or not to update the display of information on said device window when determined that all network device information was displayed in said display all sheet information step;

 a timer update set step to set an automatic update timer
10 when determined to perform updates in said update decision step;

 a timer update monitor step to determine whether or not the time is up, on the automatic update timer set in said timer update set step; and

15 an update stop monitor step to monitor if updating has stopped or not when the time has not run out on the automatic update timer monitored in the timer update monitor step.

32. A network device control unit according to claim 8,
20 wherein said information acquisition means comprising:

 display all sheet information decision means to decide whether or not to all sheet information was displayed;

 network device information hold decision means to decide whether the cache is being held when determined in

said display all sheet information decision means that not all of the information was displayed;

sheet information compulsory acquisition decision means for deciding whether or not to compulsorily acquire
5 sheet information;

network device information acquisition means to acquire information on the network device when determined in said sheet information compulsory acquisition decision means to compulsorily acquire sheet information;

10 cache comparison means to compare the cache value with the device information value newly acquired by said network device information acquisition means;

cache value hold means to hold the acquired network device information as a cache value when results of the
15 comparison of the cache value with the newly acquired device information value are determined to differ and also when determined by way of said network device holding decision means, that the previously acquired network device information is not being held;

20 network device information display means for displaying on said network device window, the cache value held by means of said cache value hold means;

sheet list status change means to change the status of currently displayed information on the sheet list to

display-completed status in order to decide whether to display all network device information in said display all sheet information means;

update decision means to decide whether or not to
 5 update the display of information on said device window when determined that all network device information was displayed in said display all sheet information means;

timer update set means to set an automatic update timer when determined to perform updates in said update decision
 10 means;

timer update monitor means to determine whether or not the time is up, on the automatic update timer set in said timer update set means; and

update stop monitor means to monitor if updating has
 15 stopped or not when the time has not run out on the automatic update timer monitored in the timer update monitor means.

33. A recording medium according to claim 9, wherein said information acquisition step comprising:

20 a display all sheet information decision step to decide whether or not to all sheet information was displayed;

a network device information hold decision step to decide whether the cache is being held when determined in said display all sheet information decision step that not

all of the information was displayed;

a sheet information compulsory acquisition decision step of deciding whether or not to compulsorily acquire sheet information;

5 a network device information acquisition step to acquire information on the network device when determined in said sheet information compulsory acquisition decision step to compulsorily acquire sheet information;

a cache comparison step to compare the cache value with
10 the device information value newly acquired by said network device information acquisition step;

a cache value hold step to hold the acquired network device information as a cache value when results of the comparison of the cache value with the newly acquired device
15 information value are determined to differ and also when determined by way of said network device holding decision step, that the previously acquired network device information is not being held;

a network device information display step of
20 displaying on said network device window, the cache value held by means of said cache value hold step;

a sheet list status change step to change the status of currently displayed information on the sheet list to display-completed status in order to decide whether to

display all network device information in said display all sheet information step;

an update decision step to decide whether or not to update the display of information on said device window when
 5 determined that all network device information was displayed in said display all sheet information step;

a timer update set step to set an automatic update timer when decided to perform updates in said update decision step;

a timer update monitor step to determine whether or
 10 not the time is up, on the automatic update timer set in said timer update set step; and

an update stop monitor step to monitor if updating has stopped or not when the time has not run out on the automatic update timer monitored in the timer update monitor step.

15

34. A network device control method utilizing SNMP protocol comprising:

a step to discriminate between MIB data requiring a write request and MIB data not requiring a write request for
 20 the SNMP agent of the network device, from among the MIB data matching the information that was write-specified by a user.

35. A network device control method comprising:

a step to store MIB data obtained from an MIB data

read-out process into an MIB data cache; and

a step to compare data stored in MIB data cache in above step with MIB data matching information write-specified by the user in an MIB data write process.

5

36. A network device control method comprising:

a step to store MIB data obtained from an MIB data write process into an MIB data cache; and

10 a step to compare data stored in MIB data cache in above step with MIB data matching information write-specified by the user in an MIB data write process.

37. A network device control method comprising:

15 a step to store MIB data obtained from an MIB data read-out process into an MIB data cache;

a step to store MIB data written in an MIB write process into an MIB data cache; and

20 a step to compare data stored in MIB data cache in either of above steps, with MIB data matching information write-specified by the user in an MIB data write process.

38. A network device control unit utilizing SNMP protocol comprising:

means to discriminate between MIB data requiring a

write request and MIB data not requiring a write request for the SNMP agent of the network device, from among the MIB data matching the information that was write-specified by a user.

5 39. A network device control unit comprising:

means to store MIB data obtained from an MIB data read-out process into an MIB data cache; and

10 a means to compare data stored in MIB data cache in above means with MIB data matching the information write-specified by a user in an MIB data write process.

40. A network device control unit comprising:

means to store MIB data obtained from an MIB data write process into an MIB data cache; and

15 means to compare data stored in MIB data cache in said means with MIB data matching the information write-specified by a user in an MIB data write process.

41. A network device control unit comprising:

20 means to store MIB data obtained from an MIB data read-out process into an MIB data cache;

means to store MIB data written in an MIB write process into an MIB data cache; and

means to compare data stored in MIB data cache by either

of said means, with MIB data matching information write-specified by the user in an MIB data write process.

42. A network device control method utilizing SNMP
5 protocol comprising:

a recording medium capable of being scanned or read
by a computer in which a program is stored to discriminate
between MIB data requiring a write request and MIB data not
requiring a write request for the SNMP agent of a network
10 device, from among the MIB data matching the information that
was write-specified by a user.

43. A recording medium capable of being read by a computer
in which programs are stored, said programs including:

15 a step of storing MIB data obtained from an MIB data
read-out process into an MIB data cache; and

a step of comparing data stored in MIB data cache in
said step with MIB data matching information write-specified
by a user in an MIB data write process.

20

44. A recording medium capable of being read by a computer
in which programs are stored, said programs including:

a step of storing MIB data obtained from an MIB data
write process into an MIB data cache; and

a step of comparing data stored in MIB data cache in said step with MIB data matching information write-specified by a user in an MIB data write process.

- 5 45. A recording medium capable of being read by a computer in which programs are stored, said programs including:

a step of storing MIB data obtained from an MIB data read-out process into an MIB data cache;

- 10 a step of storing MIB data written in an MIB write process into an MIB data cache; and

a step of comparing data stored in MIB data cache in either of said steps, with MIB data matching information write-specified by a user in an MIB data write process.

- 15 46. A network device control unit for controlling a device connected onto network utilizing SNMP protocol comprising:

holding means to hold the latest MIB data when MIB data for said device is read or when this MIB data is written for said device, by storing said MIB data into the specified cache
20 memory;

comparison means to compare the latest MIB data for said device held by said holding means when writing of new MIB data was specified for said device and excluding cases where writing of said MIB data already has sufficient

significance; and

control means to update said holding means and also
write the applicable MIB data into said device, only when
results from the above comparison means show a difference
5 between the newly written MIB data and the held MIB data.

47. A network device control unit according to claim 46,
wherein said cache memory is jointly shared by the entire
network.

10

48. A network device control method according to claim 22 ,
wherein said initial sheet information acquisition step
comprising:

a sheet information compulsory acquisition decision
15 step of deciding whether or not to compulsorily acquire sheet
information;

an instant display step to display a portion of the
information beforehand based on the currently held sheet
information, when decided not to perform compulsory
20 acquisition in said sheet information compulsory acquisition
decision step;

a display all sheet information step to decide whether
or not all sheet information was displayed when decided to
perform compulsory acquisition in said sheet information

compulsory acquisition decision step;

a network device information acquisition step of acquiring network device information;

a network device holding decision step to decide
5 whether or not previously acquired network device
information (hereafter called "cache") is being held;

a cache comparison step to compare the cache value with
the network device information value newly acquired by way
of said network device acquisition step when determined to
10 hold in cache by said network device holding decision step;

a cache value hold step to hold the acquired network
device information as a cache value when results of the
comparison of the cache value with the newly acquired network
device information value are determined to differ and also
15 when decided a cache is not being held by way of said network
device holding decision step;

a network device information display step to display
on said device window, said cache value held in said cache
value hold step;

20 a sheet list status change step to change the status
of currently displayed information on the sheet list to
display-completed status in order to decide whether to
display all network device information in said display all
sheet information step;

an update decision step to decide whether or not to update the display of information on said device window when decided all network device information was displayed in display all sheet information step;

5 a timer update set step to set an automatic update timer when determined to perform updates in the update decision step;

a timer update monitor step to determine whether or not the time is up, on the automatic update timer set in said
10 timer update set step; and

an update stop monitor step to monitor if updating has stopped or not when the time has not run out on the automatic update timer monitored in the timer update monitor step.

15 49. A network device control unit according to claim 23, wherein said information acquisition means comprising:

sheet information compulsory acquisition decision means for deciding whether or not to compulsorily acquire sheet information;

20 instant display means to display a portion of the information beforehand based on the currently held sheet information, when decided not to perform compulsory acquisition in said sheet information compulsory acquisition decision means;

display all sheet information means to decide whether or not all sheet information was displayed when decided to perform compulsory acquisition in said sheet information compulsory acquisition decision means;

5 network device information acquisition means for acquiring network device information;

 network device holding decision means to decide whether or not previously acquired network device information (hereafter called "cache") is being held;

10 cache comparison means to compare the cache value with the network device information value newly acquired by way of said network device acquisition means when determined to hold in cache by said network device holding decision means;

 cache value hold means to hold the acquire network
15 device value as a cache value when results of the comparison of the cache value with the newly acquired network device information value are determined to differ and also when decided a cache is not being held by way of said network device holding decision means;

20 network device information display means to display on said device window, said cache value held in said cache value hold means;

 sheet list status change means to change the status of currently displayed information on the sheet list to

value hold step;

a sheet list status change step to change the status of currently displayed information on the sheet list to display-completed status in order to decide whether to
5 display all network device information in said display all sheet information step;

an update decision step to decide whether or not to update the display of information on said device window when decided all network device information was displayed in
10 display all sheet information step;

a timer update set step to set an automatic update timer when determined to perform updates in the automatic update decision step;

a timer update monitor step to determine whether or
15 not the time is up, on the automatic update timer set in said timer update set step; and

an update stop monitor step to monitor if updating has stopped or not when the time has not run out on the automatic update timer monitored in the timer update monitor step.

20

51. A network device control method according to claim 48, wherein said instant display step comprising:

a sheet information list decision step of deciding whether the three steps of a cache value enable decision step,

currently held sheet information list;

cache value enable decision means to decide whether
information in said sheet information list was previously
acquired, when determined by utilizing the sheet information
5 list decision means, that said cache value enable decision
means and the two means of network device information display
means and sheet information list status change means were
not implemented for the entire sheet information list;

network device information display means to display
10 a cache value of certain information on said device window
when determined that the information was previously acquired
by way of said cache value enable decision means; and

sheet list status change means to change the status
of currently displayed information on the sheet list to
15 display-completed status.

53. A recording medium according to claim 50, wherein
said instant display step comprising:

a sheet information list decision step of deciding
20 whether the three steps of a cache value enable decision step,
a network device information display step and a sheet
information list status change step were implemented on the
currently held sheet information list;

a cache value enable decision step to decide whether

information in said sheet information list was previously
 acquired, when determined by utilizing the sheet information
 list decision step, that said cache value enable decision
 step and the two steps of network device information display
 5 step and sheet information list status change step were not
 implemented for the entire sheet information list;

a network device information display step to display
 a cache value of certain information on said device window
 when determined that the information was previously acquired
 10 by way of said cache value enable decision step; and

a sheet list status change step to change the status
 of currently displayed information on the sheet list to
 display-completed status.

15 54. A network device control method according to claim 22 ,
 wherein said information acquisition step comprising:

a display all sheet information decision step to decide
 whether or not to all sheet information was displayed;

a network device information hold decision step to
 20 decide whether the cache is being held when determined in
 said display all sheet information decision step that not
 all of the information was displayed;

a sheet information compulsory acquisition decision
 step of deciding whether or not to compulsorily acquire sheet

information;

a network device information acquisition step to
acquire information on the network device when determined
in said sheet information compulsory acquisition decision
5 step to compulsorily acquire sheet information;

a cache comparison step to compare the cache value with
the device information value newly acquired by said network
device information acquisition step;

a cache value hold step to hold the acquired network
10 device information as a cache value when results of the
comparison of the cache value with the newly acquired device
information value are determined to differ and also when
determined by way of said network device holding decision
step, that the previously acquired network device
15 information is not being held;

a network device information display step of
displaying on said network device window, the cache value
held by means of said cache value hold step;

a sheet list status change step to change the status
20 of currently displayed information on the sheet list to
display-completed status in order to decide whether to
display all network device information in said display all
sheet information step;

an update decision step to decide whether or not to

update the display of information on said device window when determined that all network device information was displayed in said display all sheet information step;

5 a timer update set step to set an automatic update timer when determined to perform updates in said update decision step;

a timer update monitor step to determine whether or not the time is up, on the automatic update timer set in said timer update set step; and

10 an update stop monitor step to monitor if updating has stopped or not when the time has not run out on the automatic update timer monitored in the timer update monitor step.

55. A network device control unit according to claim 23,
15 wherein said information acquisition means comprising:

display all sheet information decision means to decide whether or not to all sheet information was displayed;

network device information hold decision means to decide whether the cache is being held when determined in
20 said display all sheet information decision means that not all of the information was displayed;

sheet information compulsory acquisition decision means for deciding whether or not to compulsorily acquire sheet information;

network device information acquisition means to acquire information on the network device when determined in said sheet information compulsory acquisition decision means to compulsorily acquire sheet information;

5 cache comparison means to compare the cache value with the device information value newly acquired by said network device information acquisition means;

 cache value hold means to hold the acquired network device information as a cache value when results of the
10 comparison of the cache value with the newly acquired device information value are determined to differ and also when determined by way of said network device holding decision means, that the previously acquired network device information is not being held;

15 network device information display means for displaying on said network device window, the cache value held by means of said cache value hold means;

 sheet list status change means to change the status of currently displayed information on the sheet list to
20 display-completed status in order to decide whether to display all network device information in said display all sheet information means;

 update decision means to decide whether or not to update the display of information on said device window when

determined that all network device information was displayed
in said display all sheet information means;

timer update set means to set an automatic update timer
when determined to perform updates in said update decision
5 means;

timer update monitor means to determine whether or not
the time is up, on the automatic update timer set in said
timer update set means; and

update stop monitor means to monitor if updating has
10 stopped or not when the time has not run out on the automatic
update timer monitored in the timer update monitor means.

56. A recording medium according to claim 24, wherein said
information acquisition step comprising:

15 a display all sheet information decision step to decide
whether or not to all sheet information was displayed;

a network device information hold decision step to
decide whether the cache is being held when determined in
said display all sheet information decision step that not
20 all of the information was displayed;

a sheet information compulsory acquisition decision
step of deciding whether or not to compulsorily acquire sheet
information;

a network device information acquisition step to

ABSTRACT OF THE DISCLOSURE

5 A network device control unit and method are provided in which, not all MIB objects under the control of the network management software are simultaneously acquired during startup of the network management software so the almost simultaneous flow of a large volume of SNMP packets in the LAN will not occur and along with a simultaneous reduction in the load on communications lines, the load on devices such as the printer and network board processing their SNMP packets will also become small. To accomplish this, windows allocated to individual network peripheral devices on a one to one basis and controlling the network device are utilized as device windows, and information to be displayed on the initial screen of the device window is acquired as the initial sheet and displayed. Device windows also acquire and display different sheet information on the device window when determined an entry has been made by the user requesting display of a different type of sheet information.

A screenshot of a Windows-style dialog box titled "NetSpot Password Entry". The dialog box has a standard title bar with a close button (X) in the top right corner. Inside the dialog, there is a small icon of a computer monitor with a dollar sign on the left, followed by the text "Enter the NetSpot password." Below this, there is a label "Password (P) :" followed by a rectangular text input field. Underneath the input field, there is a checkbox followed by the text "Start in user mode (U)". At the bottom of the dialog, there is a horizontal line separating the options from the buttons. Below the line are three buttons: "OK", "CANCEL", and "HELP (H)".

NetSpot Password Entry

 Enter the NetSpot password.

Password (P) :

☐ Start in user mode (U)

OK CANCEL HELP (H)

United States Patent & Trademark Office
Office of Initial Patent Examination -- Scanning Division

Application deficiencies found during scanning:

1. Application papers are not suitable for scanning and are not in compliance with 37 CFR 1.52 because:
 - ☐ All sheets must be the same size and either A4 (21 cm x 29.7 cm) or 8-1/2" x 11". Pages _____ do not meet these requirements.
 - ☐ Papers are not flexible, strong, smooth, non-shiny, durable, and white.
 - ☐ Papers are not typewritten or mechanically printed in permanent ink on one side.
 - ☐ Papers contain improper margins. Each sheet must have a left margin of at least 2.5 cm (1") and top, bottom and right margins of at least 2.0 cm (3/4").
 - ☐ Papers contain hand lettering.
2. Drawings are not in compliance and were not scanned because:
 - ☐ The drawings or copy of drawings are not suitable for electronic reproduction.
 - ☐ All drawings sheets are not the same size. Pages must be either A4 (21 cm x 29.7 cm) or 8-1/2" x 11"
 - ☐ Each sheet must include a top and left margin of at least 2.5 cm (1"), a right margin of at least 1.5 cm (9/16") and a bottom margin of at least 1.0 cm (3/8").
